

SERVICE REQUESTS PORTAL

Service Requests Portal — User Manual

Everything the portal does, and how to do it.
Everything the portal does, and how to do it

Two audiences, and you can skip half. [Part 1](#) is for anyone filing a request or following one — a few pages. [Part 2](#) is for the triage team, the reporting analysts and the super users.

Screenshots are current as of 2026-08-08 and show the real application against its demonstration data. Every one is regenerated by a single command, so a picture here is never of a build nobody is running. The contents list and every cross-reference in this PDF are clickable.

Want to try it rather than read it? [The test accounts](#) are at the end. Sign in as `bc_rep` to see what a requester sees, or `admin` to see everything.

Prefer a PDF? `docs/pdf/USER_MANUAL.pdf` is this document, screenshots and all, with the contents list and every cross-reference still clickable. `DEVELOPER_HANDOFF.pdf` and `NEXT_STEPS.pdf` sit beside it, and the links between the three work too.

Contents

Part 1 — For everyone filing a request [1.1 Signing in](#) · [1.2 What you can ask for](#) · [1.3 Filing a defect](#) · [1.4 Filing an enhancement](#) · [1.5 Asking for a report or dashboard](#) · [1.6 Checking whether it has already been reported](#) · [1.7 Attaching a screenshot](#) · [1.8 Following your request on the Status Board](#) · [1.9 Searching the board](#) · [1.10 Dark mode and phones](#)

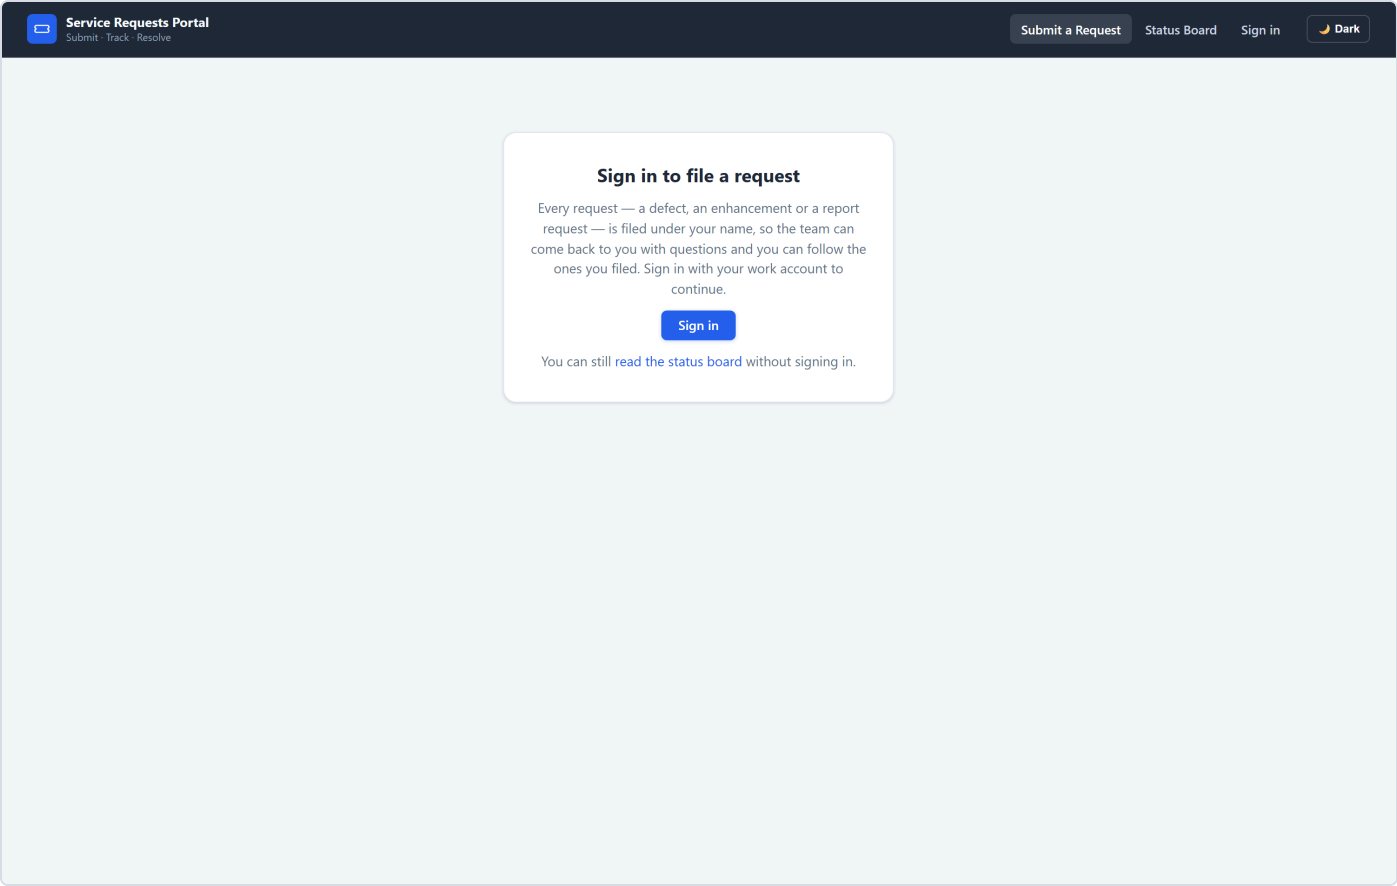

Part 2 — For the triage team [2.1 The queue](#) · [2.2 Finding things](#) · [2.3 Making the queue yours](#) · [2.4 Working a ticket](#) · [2.5 Working a report request](#) · [2.6 Sending to the Service Desk](#) · [2.7 Handing a ticket to another team](#) · [2.8 Doing things to many tickets at once](#) · [2.9 Adding a ticket by hand](#) · [2.10 Adding an application](#) · [2.11 Excel, both directions](#) · [2.12 Reporting throughput](#) · [2.13 Manage metadata](#) · [2.14 Manage access](#)

[Appendix: test accounts](#) · [Appendix: what the statuses mean](#) · [Appendix: who can see what](#)

Part 1 — For everyone filing a request

1.1 Signing in

You need to sign in before you can file anything.

Sign in required

Every request is filed under your name, so the team can come back to you with questions and you can follow the ones you filed. If you open the portal without signing in, this is what you get — a **Sign in** button, and a reminder that the Status Board is still readable without signing in.

Service Requests Portal
Submit · Track · Resolve

Submit a Request Status Board Sign in Dark

Sign In

Sign in to file a request and to follow the ones you filed. The triage team signs in here too.

Username *

Password *

Sign In

Sign in

The same sign-in page serves everybody: requesters and the triage team both use it. Where you land afterwards depends on your account — requesters go to the submit form, the triage team goes to the queue.

Reading does not need a login. The Status Board at `/public` is open to anyone. It is only *filing* that needs an account.

If you were signed in and it stopped working, you will see "*Your session has expired. Sign in again and send this once more.*" Your answers are kept — sign in and send it again. Sessions last 8 hours.

1.2 What you can ask for

Three kinds of request, chosen at the top of the form. Picking one changes the questions you are asked, because they are genuinely different things.

Choose	When	You will be asked
Defect	Something is broken or behaving wrongly	Which screen, when it happened, what you saw, and how to make it happen again
Enhancement	Nothing is broken; you want something the system does not do	What you want and what it would save you
Report request	You need a report or a dashboard, new or changed	Whose data it comes from, what it is for, and either the measures you need or what should change about an existing report

What you expected, what appeared instead, and any error message word-for-word.

Empty form

Two things on this page are worth knowing before you start:

- "Filing as ..." at the top of the form is **who the request will belong to** — your name, and nothing else. It is not the application the request is about; that is the picker further down, and only you can answer it. (It used to read "Filing as Bailey Rep (Billing Center)", which looked exactly like the answer to a question it was not answering. The team was never a property of the request.)

Service Requests Portal — User Manual

Page 6 of 66

- **The rail on the right** — "Before you submit" — ticks items off as you type, and the **Submit** button lives there. You can press it with fields still empty: it will point them out rather than refusing to explain.
- **The rail on the right** — "Before you submit" — ticks items off as you type, and the **Submit** button lives there. You can press it with fields still empty: it will point them out rather than refusing to explain.

1.3 Filing a defect

The screenshot shows the 'Submit a service request' form in the Service Requests Portal. The form is divided into several sections: 'YOUR REQUEST' with radio buttons for Defect, Enhancement, and Report request; 'BEFORE YOU SUBMIT' with a checklist of required information and a 'Submit request' button; 'WHERE IT HAPPENED' with fields for screen title, date, time, and reference numbers; and 'WHAT HAPPENED' with a text area for the description. The 'Defect' radio button is selected. The 'BEFORE YOU SUBMIT' section includes a 'Status Board' link and a 'Submit request' button. The 'WHERE IT HAPPENED' section includes a 'Check for duplicates' button. The 'WHAT HAPPENED' section includes a '0 characters' indicator.

Transaction number e.g. 90211884

WHAT HAPPENED

Exactly what you saw * 0 characters

What you expected, what appeared instead, and any error message word-for-word.

Defect branch

Four sections, top to bottom.

Your request — your one-line summary. Keep it specific: *"Direct bill invoice shows a zero balance while a payment is still pending"* is far more useful than *"invoice wrong"*, and the duplicate check works better with it.

Where it happened — the screen title, and the date and time. Policy, account and transaction numbers are optional but they are the fastest way for somebody to reproduce what you saw.

What happened — what you expected, what appeared instead, and any error message **word for word**. Then the steps that make it happen again.

Do you need a workaround? — tick this if you are **blocked on a live case right now**. It is not the same as "please fix it": it tells the team somebody is waiting, and it shows on the queue as a red banner until it is handled. Your request keeps its place in the queue either way.

3 Submitted to Service Desk

Approved items go to the Service Desk and get a ticket number you can track.

Enhancement branch

A shorter form, because there is nothing broken to describe. Say what you want and **what it would save you** — time per case, errors avoided, calls prevented. That sentence is what the request is prioritised on, so it is worth a minute.

Service Requests Portal — User Manual

Page 11 of 66

1.5 Asking for a report or dashboard

Report requests go to the reporting analysts, not to the Service Desk. They are built in-house, so the questions are about what you need rather than what is broken.

First: whose data is it?

You can press Submit with fields empty — we will point them out first.

WHAT HAPPENS NEXT

1 Reported

Your request appears on the Status Board straight away with a reference number.

2 Picked up

A reporting analyst on the team takes it and sizes the work.

3 Delivered

You'll see it marked complete on the board, with the date it was finished.

New dashboard

"Which application is the data from?" means **the system the numbers come out of**, not the team asking for them. If it spans more than one, or you are not sure, choose **Other** — it goes to every reporting analyst and they will route it.

Then: something new, or a change to one you already use?

Service Requests Portal — User Manual

Page 12 of 66

Something new

The form is titled 'Submit a service request' and includes a 'Status Board' link. It has three tabs: 'Defect', 'Enhancement', and 'Report request' (selected). The 'YOUR REQUEST' section includes a 'Filing as' field (filled with 'Baleiy Rep'), a 'Summarize it in one line' field (with an example: 'e.g. Weekly unapplied cash by billing centre'), and a 'Which application is the data from?' dropdown (with an example: 'Already reported?'). The 'WHAT YOU NEED' section includes a 'Describe what you need' field (with a character count) and a 'What data does it need?' field (with a character count). The 'BEFORE YOU SUBMIT' section includes a 'Submit request' button and a 'Check for duplicates' button. The 'WHAT HAPPENS NEXT' section includes a 'Reported' step (with a character count) and a 'Picked up' step (with a character count).

New

A change to one you already use

The form is titled 'Submit a service request' and includes a 'Status Board' link. It has three tabs: 'Defect', 'Enhancement', and 'Report request' (selected). The 'YOUR REQUEST' section includes a 'Filing as' field (filled with 'Baleiy Rep'), a 'Summarize it in one line' field (with an example: 'e.g. Weekly unapplied cash by billing centre'), and a 'Which application is the data from?' dropdown (with an example: 'Already reported?'). The 'WHAT YOU NEED' section includes a 'Describe what you need' field (with a character count) and a 'What data does it need?' field (with a character count). The 'BEFORE YOU SUBMIT' section includes a 'Submit request' button and a 'Check for duplicates' button. The 'WHAT HAPPENS NEXT' section includes a 'Reported' step (with a character count) and a 'Picked up' step (with a character count).

Change

Something new asks for:

- **What you need** — what it should show, who will read it, and what decision it helps them make.
- **What data it needs** — fields, systems, date ranges. Anything you know.
- **The measures and where they come from** — one per line. *"Unapplied cash total — from the nightly billing extract"* is exactly the right level of detail. This is the field an analyst starts from.
- **Who to ask** — a name and email for the questions that will come up.

A change asks **which report first**, because nobody can change one they cannot find. A link, a share-drive path, or *"the menu item I open it from"* are all valid answers. Then what it gives you today and where that falls short, and what should change — *"a new column, a different filter, a number that reads wrong, a different cut of the same data."*

Both branches also ask **how often you will use it** (Daily / Weekly / Monthly / Quarterly / Annually / One-off) and **your department**. Both help with sizing and prioritisation.

Report requests are private. Only you can see one you filed — not the rest of the board. They name internal datasets, departments and often what somebody is trying to measure, so they are not public reading. A consequence worth knowing: the duplicate check on this branch only finds **your own** report requests, so it will not tell you that a colleague asked for the same dashboard.

1.6 Checking whether it has already been reported

This is the most useful thing on the page. Write your one-line summary, press **Check for duplicates**, and see what already exists.

It searches **all time**, deliberately — a defect reported two years ago and since fixed is exactly the answer you need. It also searches **only the kind of request you are filing**, and says so, because a broken invoice screen has nothing to do with a dashboard.

If nothing matches: *"None of these match what you saw? Carry on below — a second report with fresh detail is more use to the team than none."* It describes what it found; it never tells you not to file.

If you edit your summary afterwards, it offers a **re-check** rather than quietly showing matches for the old wording.

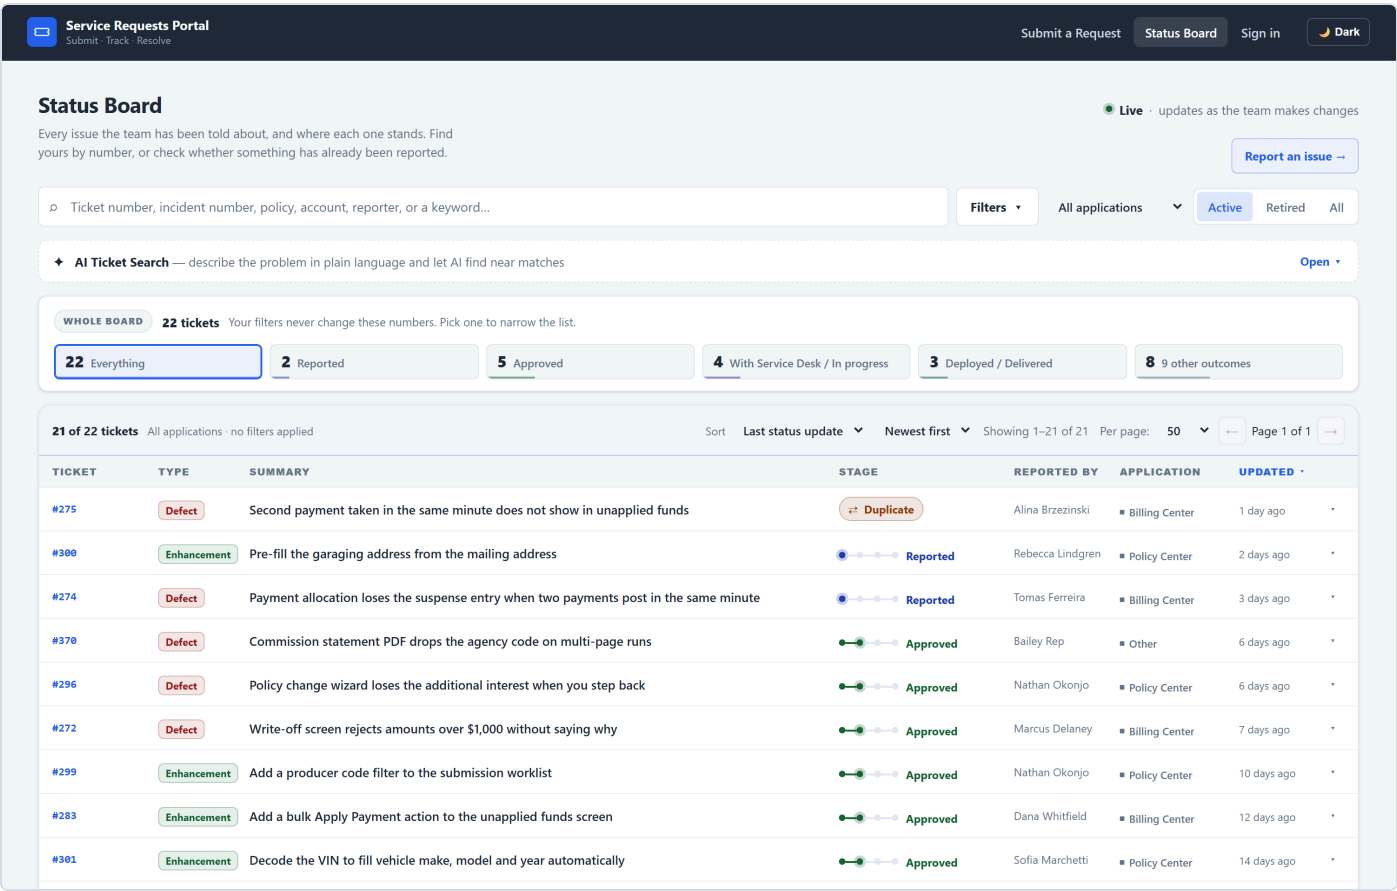

1.7 Attaching a screenshot

Three ways, and the third is the one most people want:

1. **Drag** a file onto the drop zone.
2. **Browse** for it.
3. **PrintScreen, then Ctrl+V** anywhere on the page. You do not have to click the drop zone first.

Up to **3 images**, 10 MB each — PNG, JPG, GIF, WEBP, BMP or HEIC. Documents and spreadsheets are not accepted here; put the detail in the description instead.

1.8 Following your request on the Status Board

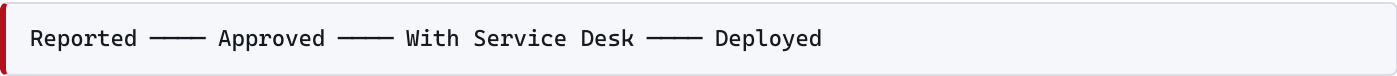

Status board

Every request the team has been told about, and where each one stands. It updates live as the team works — no refresh needed.

The tiles across the top describe the whole board, and say so: "Your filters never change these numbers." Clicking one filters the table to it; clicking it again clears back to everything. The band below the tiles describes the rows in the table and carries its own count.

The four pips on each row are the position of your request, which is easier to read at a glance than a status word:

Click a row to open it.

#309

Report request track

Reported — Approved — In progress — Delivered

Some requests do not draw a track at all, and that is deliberate:

- **Rejected · Duplicate · Retired** — these have ended. You get the outcome and a one-line explanation, because drawing a track would imply something more is coming.
- **On hold · Backlog · Future Consideration · Deferred** — these say *parked* rather than showing a stalled track.

#296	Defect	Policy change wizard loses the additional interest when you step back	Approved	Nathan Okonjo	Policy Center	6 days ago
#272	Defect	Write-off screen rejects amounts over \$1,000 without saying why	Approved	Marcus Delaney	Billing Center	7 days ago

Ticket search

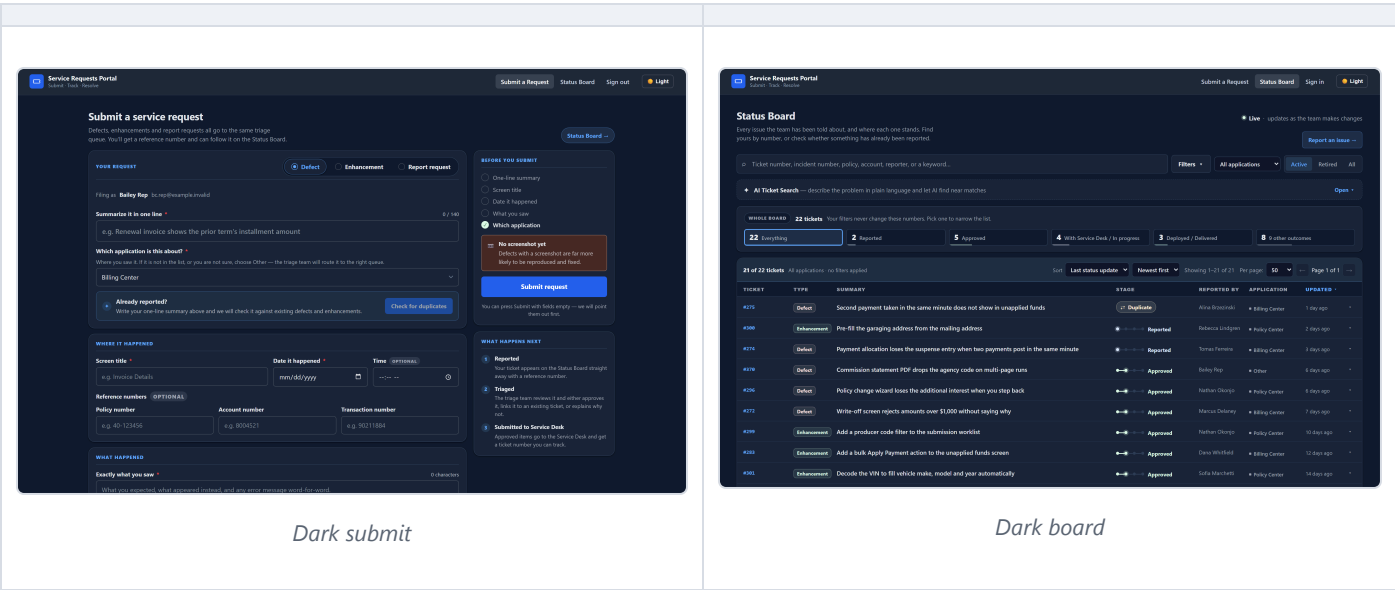

Describe an issue in plain language and see whether it has been reported and what happened to it. Results come back in **two separate sections**, and the distinction matters:

- **Closest matches** — requests that are *about the same thing*, whatever words they used.
- **Keyword matches** — requests whose **ID, incident number, Jira number, policy, account, reporter or text literally contains what you typed**. This is where a pasted incident number or policy number will be found.

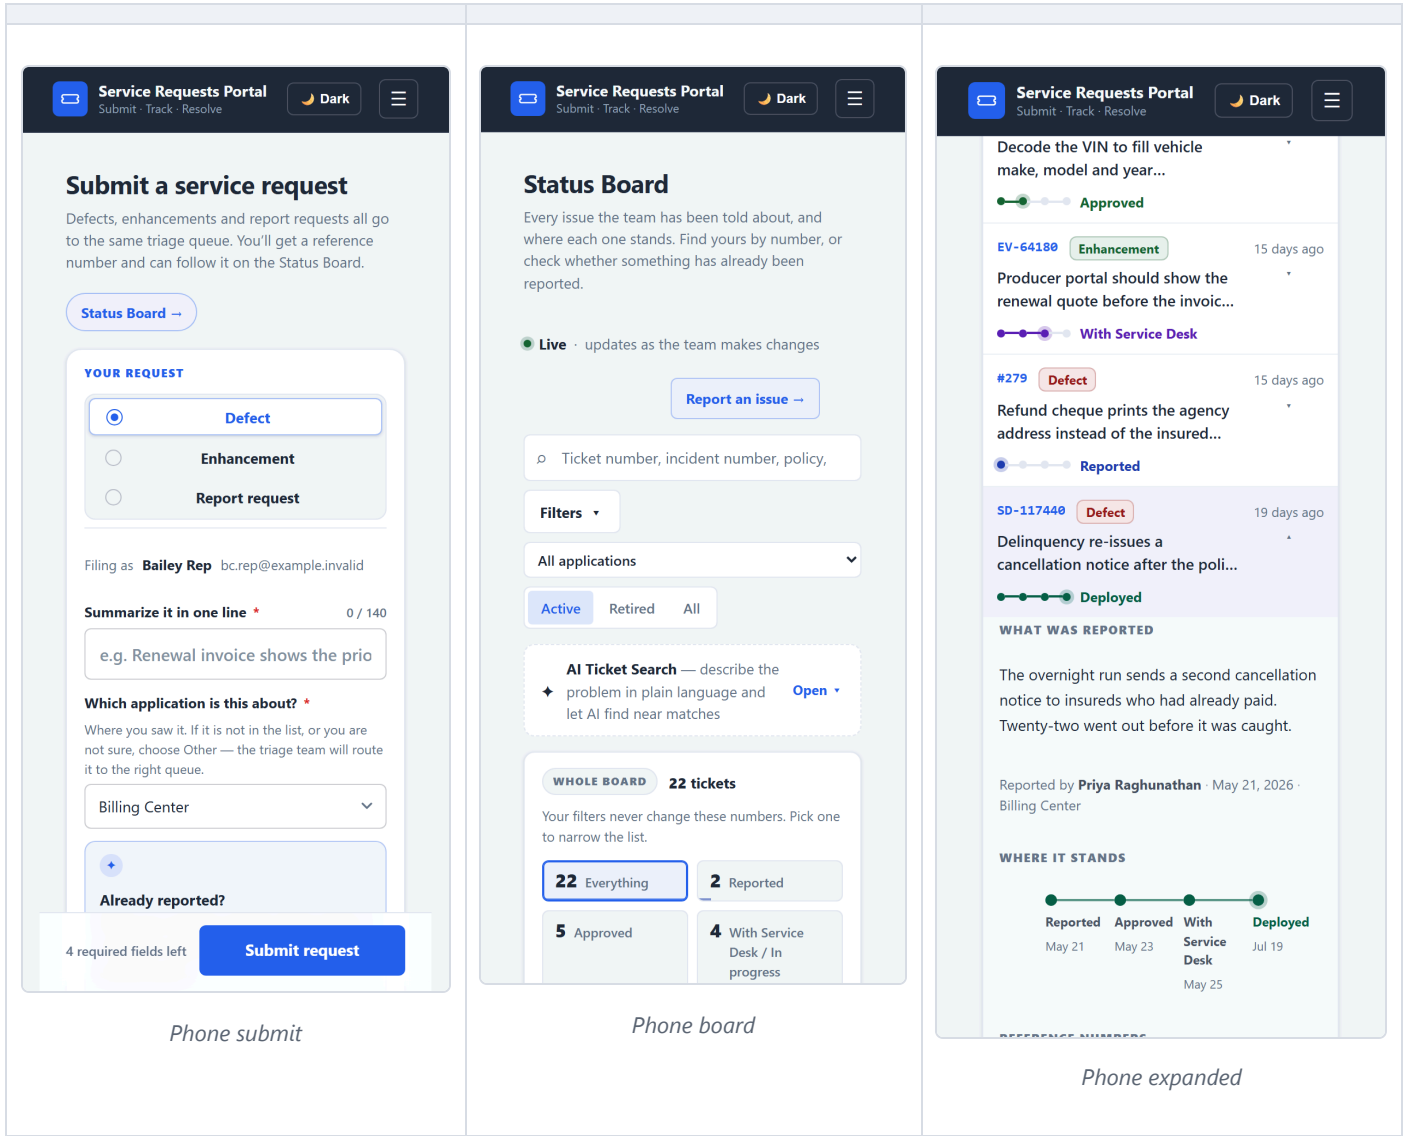

The summary **describes what it found**. It will not tell you whether your issue is a duplicate — that is a triage decision, and it says so rather than guessing.

1.10 Dark mode and phones

The **Dark / Light** button is in the header, top right. Your choice is remembered, and the first time you visit it follows your operating system's setting.

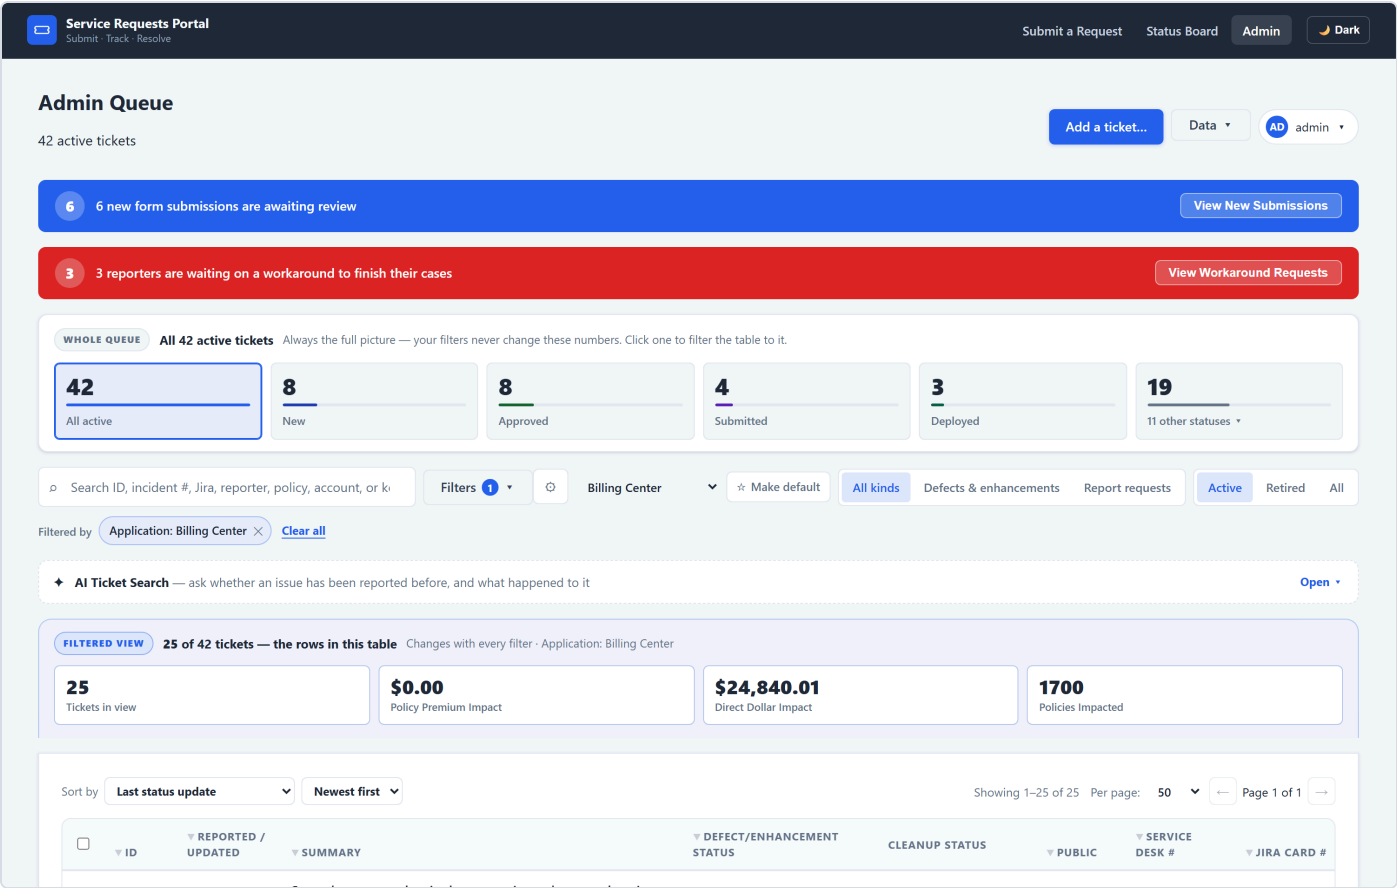

Every screen works on a phone.

On a narrow screen the **Submit** button moves to a bar pinned to the bottom, so it is always reachable.

Part 2 — For the triage team

2.1 The queue

Admin queue

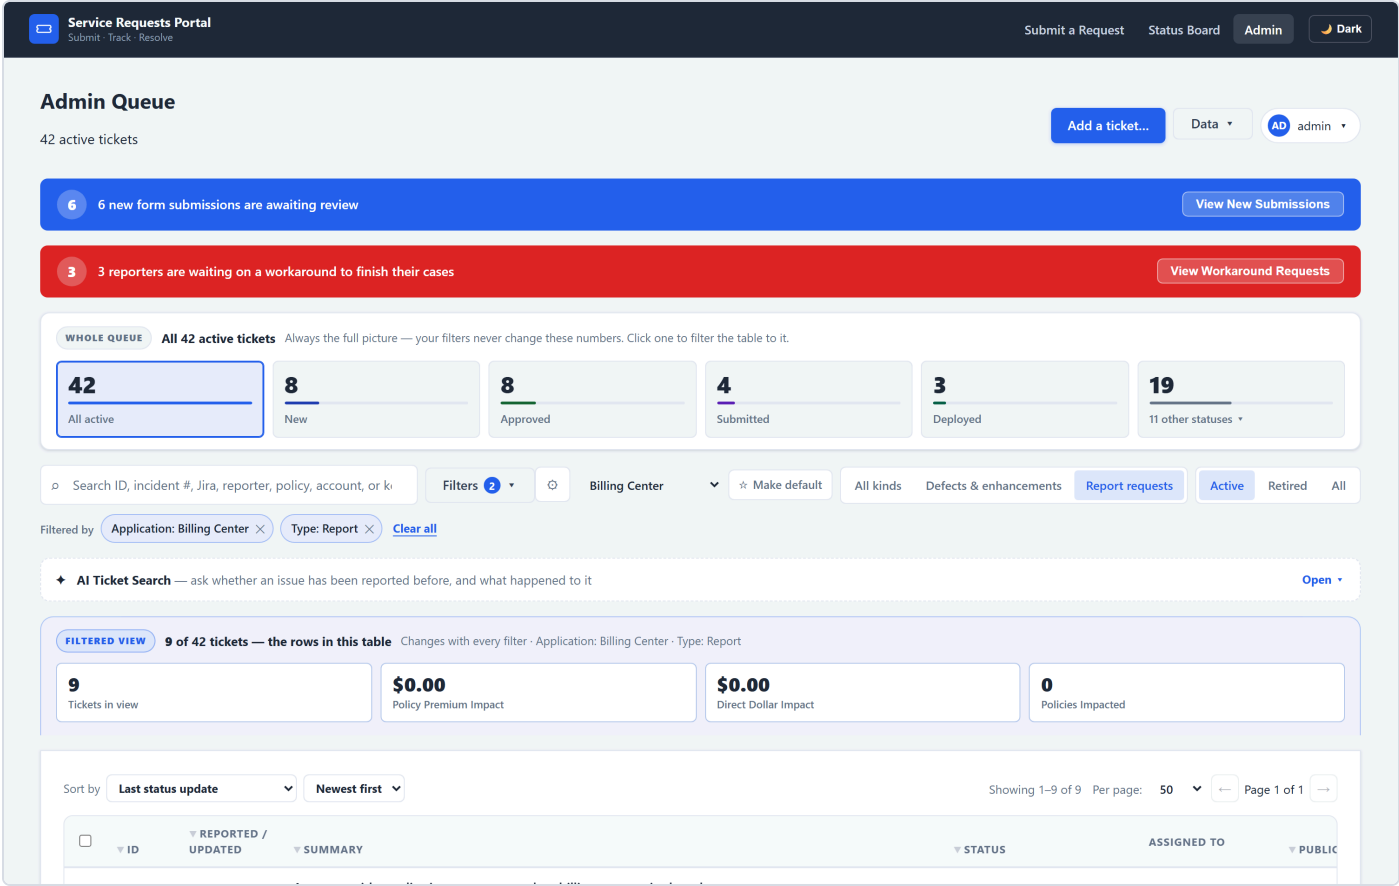

Your working surface. From the top:

1. **Alert banners.** "*N new form submissions are awaiting review*" and "*N reporters are waiting on a workaround to finish their cases*". Each has a button that filters the table to exactly those. Taking one leaves a **"Back to ..."** chip so you can return to where you were — answering "what's new?" should not cost you your place.
2. **The `WHOLE QUEUE` strip.** Filter-independent counts, one card per headline status, with the rest summed into an expandable "other statuses" card. "*Always the full picture — your filters never change these numbers. Click one to filter the table to it.*"
3. **The command bar.** Search · Filters ·  · the application queue · the kind of work · Active / Retired / All.
4. **Applied filter chips**, each removable on its own.
5. **Ticket search**, collapsed so the table stays above the fold.
6. **The `FILTERED VIEW` band.** Counts for the rows below, **plus** Policy Premium Impact, Direct Dollar Impact and Policies Impacted for the current view.
7. **The table.** Sortable, inline-editable, multi-select.

Only **New** rows carry a coloured stripe down the left. Every status used to have one, which meant the stripe distinguished nothing. The status is already in its own column with its own badge; the stripe now marks the one thing that column cannot say at a glance — *nobody has looked at this yet*.

Four columns are editable in place, without opening anything: status, cleanup status, public visibility and type.

The two kinds of work

Report queue

All kinds · Defects & enhancements · Report requests in the command row. This is one click, and the report queue is genuinely a different view: its own columns (ID · Reported/Updated · Summary · Status · Assigned To · Public) and its own saved layout. Switching does not lose your column choices for the other queue.

Scoped to one application

You see only the applications you have been granted. If that is more than one, the select lets you switch between them, and **"Make default"** pins one as where you land next time.

Switching is a look; pinning is a decision. They are separate clicks on purpose — glancing at another team's queue should not silently change where you start tomorrow.

The Other queue

Other is a real queue, not a holding pen. Two quite different things land in it:

- **A system with no Service Desk connection.** There is no configured application to raise its tickets in, so the work is tracked here and the Service Desk ticket is raised **by hand** (§2.6).
- **A system nobody has identified yet.** Somebody reported a problem or asked for a report and it is not yet clear whose data it is about.

Either way the work still has to be tracked, so it is tracked here — think of it as a task list. Reports get built out of it, defects and enhancements get worked out of it, and it takes **every kind of request**.

A ticket in Other can also appear in your own queue, without leaving Other. See §2.4 — *Also show it in*.

Analyst queue

The same page as a reporting analyst whose grant covers report requests on one application. **No defect is on this screen**, there is no application switcher (there is nothing to switch to), and there is no *Manage metadata* in the menu. This is not the queue with rows hidden — it is what the server sends.

Your grant covers an application *and* a request type, and both are enforced. If you work report requests for Billing Center, that is what you get — switching to *All kinds* shows you no defects, because there are none to show you. The same applies to the banner: you are told about new requests and workarounds **in the work you actually do**, and nothing else.

2.2 Finding things

The screenshot shows the 'Admin Queue' section of the 'Service Requests Portal'. At the top, there's a navigation bar with 'Submit a Request', 'Status Board', 'Admin', and a 'Dark' mode toggle. Below the header, the 'Admin Queue' title is followed by '42 active tickets'. A blue button 'Add a ticket...' and a 'Data' dropdown are on the right. A blue banner indicates '6 new form submissions are awaiting review' with a 'View New Submissions' button. A red banner indicates '3 reporters are waiting on a workaround to finish their cases' with a 'View Workaround Requests' button. Below these, a 'WHOLE QUEUE' section shows 'All 42 active tickets' and a note: 'Always the full picture — your filters never change these numbers. Click one to filter the table to it.' This section contains six status cards: '42 All active', '8 New', '8 Approved', '4 Submitted', '3 Deployed', and '19 11 other statuses'. A search bar and a 'Filters' button are present. Below the search bar, there are tabs for 'All kinds', 'Defects & enhancements', 'Report requests' (selected), 'Active', 'Retired', and 'All'. A 'Filtered by' section shows 'Application: Billing Center' and 'Type: Report'. The 'All filters' section is divided into four columns: 'TICKET' (Defect/Enhancement Status, Type, Year, Workaround), 'CLEANUP' (Cleanup Required, Cleanup Status), 'PEOPLE & SOURCE' (Requester, Submitted by (Service Desk), Created Via), and 'REFERENCES' (EASYVISTA #, JIRA #, Release #, In JIRA). Each column has a dropdown menu. A '2 applied' indicator is on the right.

Filters

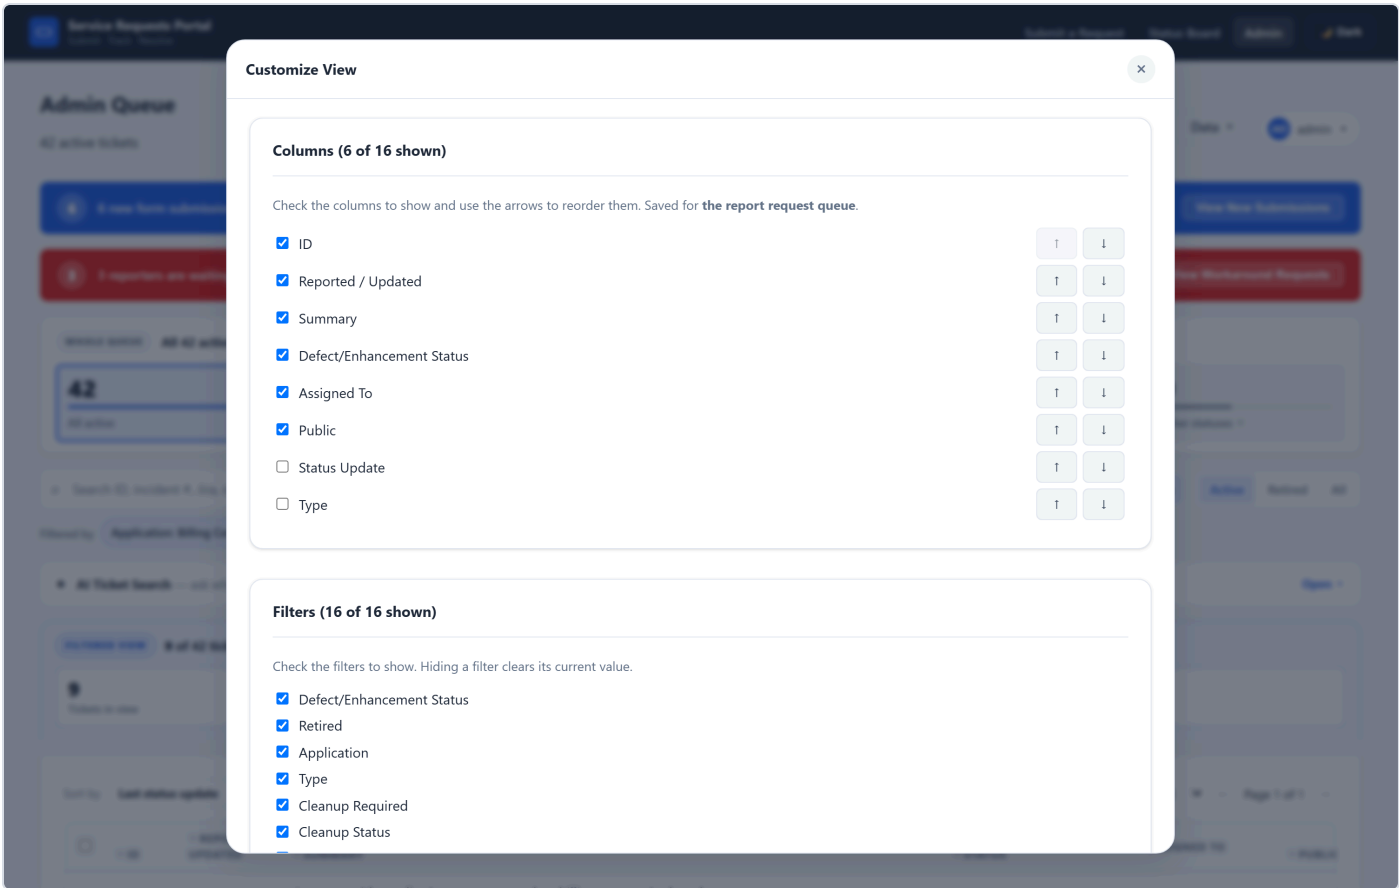

Search covers ID, incident number, Jira number, reporter, policy, account and keywords. **Filters** holds the rest, in named groups so you can jump rather than read all of them.

Two things worth knowing:

- **The workaround filter has three states, not two.** A ticket nobody flagged is neither *open* nor *handled*, so "handled" does not sweep it in.
- **Sorting is separate from which columns you show.** You can sort by a field whose column is hidden. Both the header click and the sort control do the same thing.

Ticket search works the same as on the public board, but over everything you can see rather than only public rows.

2.3 Making the queue yours

Customize view

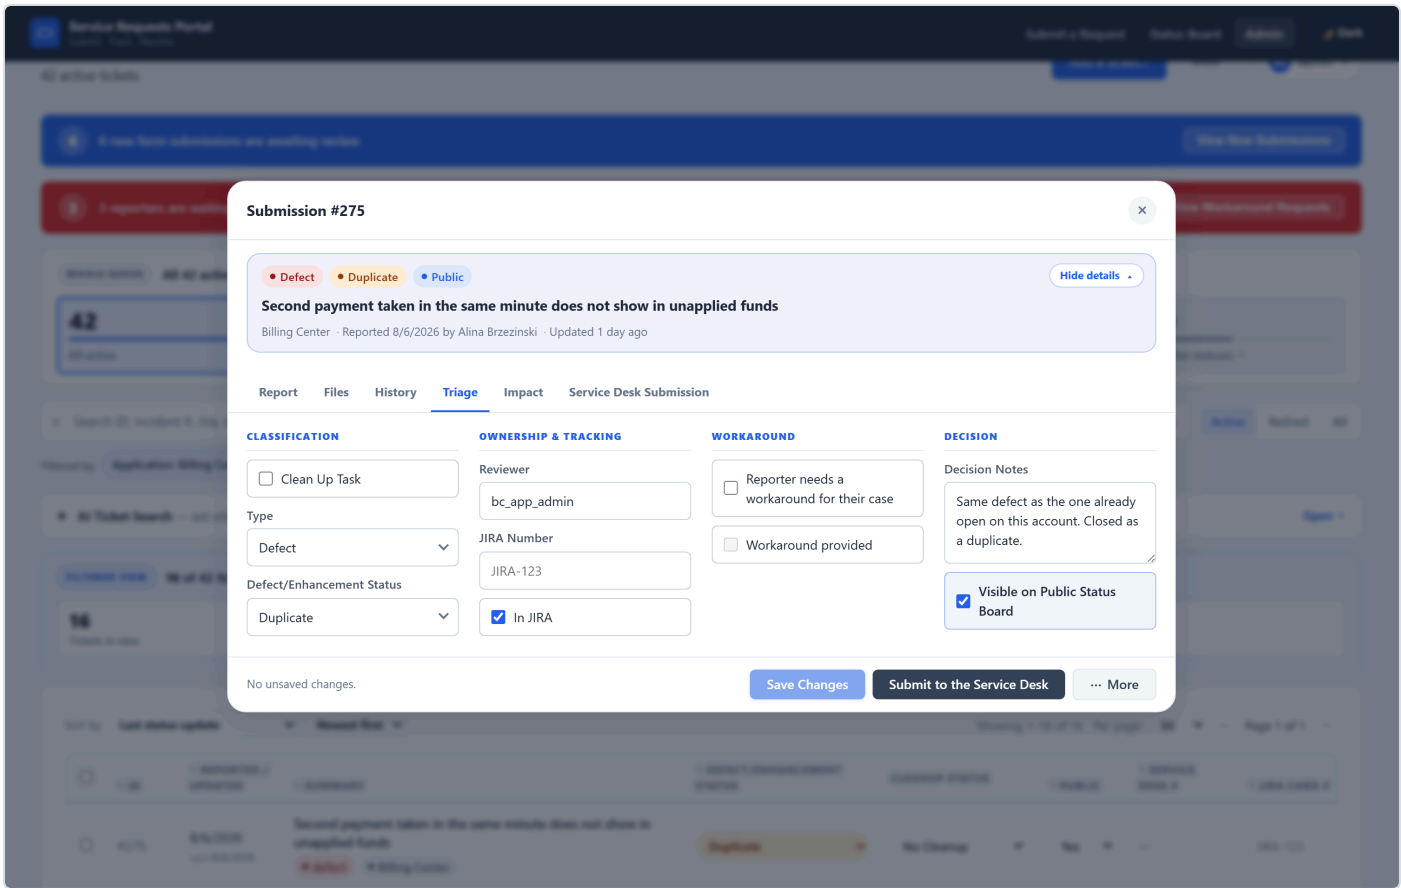

The  button. Choose which columns show and in what order, and which filters show. **Saved to your account, not your browser**, so it follows you between machines.

A filter you hide has its **value cleared**, so a filter you cannot see can never quietly be constraining the table.

2.4 Working a ticket

Click any row. **Six tabs**, and the things that need your attention — the identity band, the alerts and the action bar — sit **outside** them, so nothing important can hide behind a tab you are not on.

Triage — where it opens

Triage tab

The decisions you make on nearly every ticket: **status**, priority, duplicate reference, decision notes, Jira number, public visibility, retire, and who it is assigned to.

Reviewer fills in with your name when you save, not when you open — otherwise every ticket would look edited the moment somebody glanced at it.

Which statuses you can choose depends on the type. A report request offers its nine; everything else offers the rest. See [the appendix](#).

"Also show it in" — putting an Other ticket on your own list

A defect in Other

Two things in one picture: the picker under *Ownership & tracking*, and the footer where **Submit to the Service Desk** is **greyed out** with the note telling you what to do instead (§2.6).

Only on a ticket in `Other`, under *Ownership & tracking*, there is a picker offering the queues you work in.

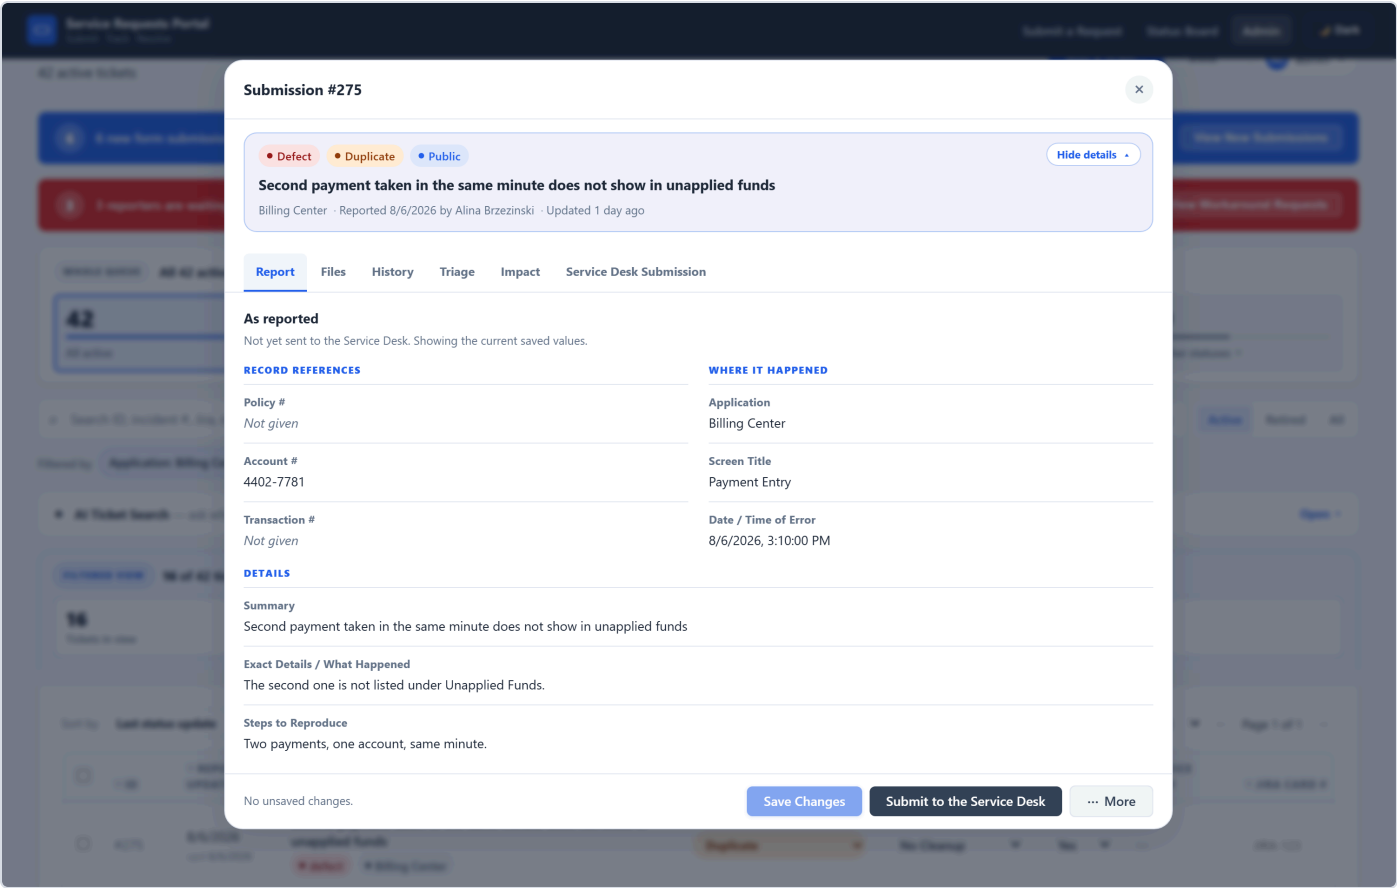

`Other` is where work is tracked for systems the Service Desk is not wired up to, and for ones nobody has identified yet (§2.1) — so if you pick one up, you have had two bad options: move it into a real application, which claims the system *is* that one, or leave it where you never see it again.

This is the third. Pick a queue and the ticket **also appears there**, while staying in `Other`:

- It does **not** move. `Other` is still its application, so the Service Desk hand-off stays correctly greyed out and the incident number stays something you type in (§2.6).
- It shows up in **both** lists — yours and `Other`.
- Only queues **you** work in are offered, so nobody can put work on another team's list.
- **Moving the status off `New` sets it for you** when you work in exactly one queue. With more than one, it waits for you to choose — guessing would put the ticket on a list you did not pick, which is harder to notice than it not appearing at all.

Choose "*Nowhere else*" to take it back off your list. If the ticket is later redirected into a real application, the association is dropped: that queue has its answer now.

Report — what they actually wrote

Report tab

The request as it came in, **read-only**. This is a record, not a working copy — the editable versions of these fields live on the Service Desk tab, which is the only reason to change them.

Service Desk tab

See 2.6.

The action bar, and More

More actions

Save Changes is the one primary action. The outbound action sits beside it, and the rarely-used ones — **Retire**, **Change visibility**, **Redirect** — are behind ... **More**. Retiring asks first. Redirect is hidden when there is nowhere to send it.

Two things that will interrupt you, and what they mean

- **"Another admin has this ticket open."** Advisory — they may have walked away. You can **edit anyway**.
- **"This ticket lives in a queue you do not administer."** Not overridable. The server will refuse the save, so offering an override would only produce an error.

If somebody else saves while you have edits open, you get a **field-by-field comparison**: what you changed, what they changed, and which to keep. If you had *no* unsaved edits, it just refreshes quietly — there is nothing to lose.

2.5 Working a report request

A report request has the same six tabs, but two of them are different.

Its Report tab has its own layout, because a dashboard that does not exist yet has no screen, no error message and no steps to reproduce:

Submission #309

Report • Delivered • Public [Hide details](#)

Accounts with a policy in one system and no billing account in the other
Billing Center · Reported 6/23/2026 by Bailey Rep · Updated 4 days ago

Report Files History Triage Impact Delivery

As requested

Not given	

WHAT THEY NEED

Summary
Accounts with a policy in one system and no billing account in the other

Described in their words
A reconciliation list of accounts that exist on one side and not the other, so the gaps can be worked through.

Data it needs
Account numbers from both systems.

No unsaved changes. [Save Changes](#) [More](#)

Report request

- **What it is for** — the application, the department, how often it will be used, and when they want it.
- **Who to ask** — the primary contact, and who requested it.
- **What they need** — the summary, their description, the data it needs, and either the measures and sources or which report and what should change.

Its sixth tab is Delivery, not Service Desk — nothing about a report request goes to the Service Desk:

Delivery pane

Section	What it is for
Go-ahead	Who approved the resources to build this, and when. A manager or supervisor saying yes to the spend — which is a different question from triage saying the request is valid. You can attach the approval itself as evidence. Both a name and a date are needed before it counts as approved.
Level of effort	S (up to 2 days) · M (up to a week) · L (up to a month) · XL (more than a month)
Hours	One entry per sitting: who, how many hours, and the day the work happened — not the day you typed it in. Quarter-hour granularity. This is what the throughput page reports on.
Assigned to, and the trail	The current holder, plus every hand-over before them. Reassigning does not erase who held it.
Delivery notes	What you actually delivered, in your words — including the compromises. <i>"Agency grouping comes from the producer code, so accounts with no producer land in an Unassigned bucket — agreed with Renata as acceptable."</i> This is the field the requester's question gets answered from six months later.

Marking a report request Delivered records the completion date automatically, which is what the throughput page counts by.

Also missing from a report request, on purpose: Release # and Release Notes (nothing ships), and the Workaround section on Triage (nothing is broken). Its Impact tab is impact notes alone — dollar impact and policies affected are defect measures.

2.6 Sending to the Service Desk

The Service Desk tab shows **exactly what will be transmitted**, editable in place, what sending will do, and what is stopping it.

Three things to know:

1. **The preview cannot lie.** It is built by the same code as the real request.
2. **The Service Desk accepts a defect or an enhancement and nothing else.** A cleanup-only task must have a type chosen before it can go. Which fields *block* the send follows the type you choose, not the ticket's own.
3. **Re-sending does not update the existing incident.** It creates a **new** ticket here and a **new** incident there, linked both ways, and leaves the original alone.

A report request cannot be sent at all, and the button is not offered.

When the application is not wired up to the Service Desk

Send greyed out

Some systems have no Service Desk catalog configured, so the portal cannot raise a ticket in them. **Other** is the **clearest example** — it is the queue for exactly that case (§2.1).

For those, **Submit to the Service Desk is greyed out**, and the reason under the buttons tells you what to do instead:

"Other is not wired up to Service Desk, so this cannot be sent from the portal. Raise it in Service Desk by hand, then come back, unlock the Service Desk ticket number on this tab and enter the number it gave you, and set the status to Submitted."

So the procedure is:

1. Raise the ticket on the Service Desk site yourself.
2. Come back here, open the **Service Desk** tab and click **Unlock to edit** beside the ticket number.
3. Type in the number it gave you and save.
4. Set the status to **Submitted** on the Triage tab.

The ticket now carries the reference to the real incident, and the board reads the same as one the portal sent itself.

The incident number can be edited behind an unlock. For a ticket the portal sent, that number is its own record of what it did — so changing it is deliberate. For an application whose tickets are raised by hand, this is where the number goes.

Transmission is off unless it has been deliberately switched on. Having credentials configured is not enough. If sending is not live, the flow still works end to end for demonstration and says so.

2.7 Handing a ticket to another team

... **More** → **Redirect**. Pick the receiving application and add a note.

The ticket moves — it is not copied. Three consequences:

1. **It lands as New** for the receiving team, who have not triaged it. Its history travels with it, so they can see it was Approved when it was sent.
2. **Your team keeps reading it and stops changing it**, immediately. You can still follow where your ticket went.
3. **Your note is internal**. The requester sees *that* their request moved, when, and between which teams — never what was said about it.

2.8 Doing things to many tickets at once

2 tickets selected — across every page of this filtered view

Make public Make private Retire Unretire Clear

Bulk actions

Tick rows to raise the bulk bar. You can **retire**, **unretire** and **change public visibility** across a set.

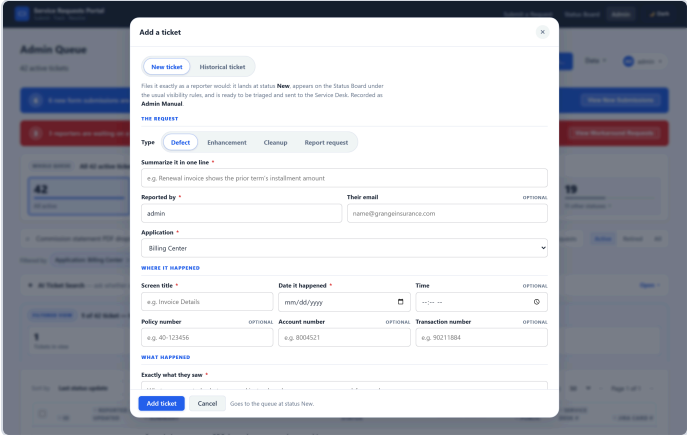

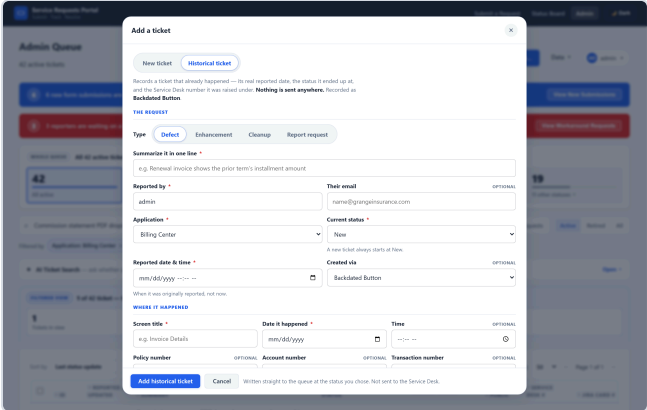

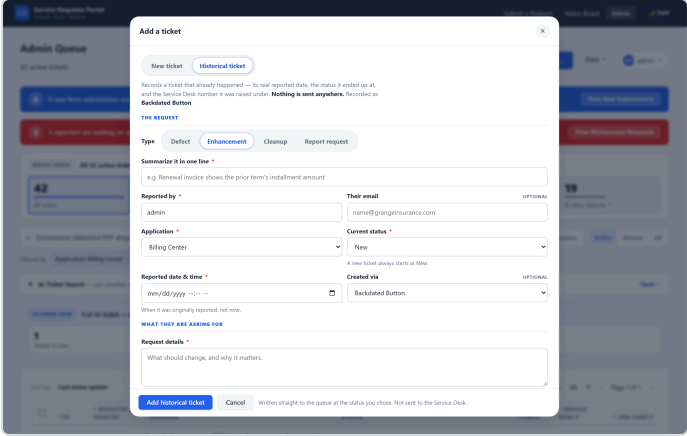

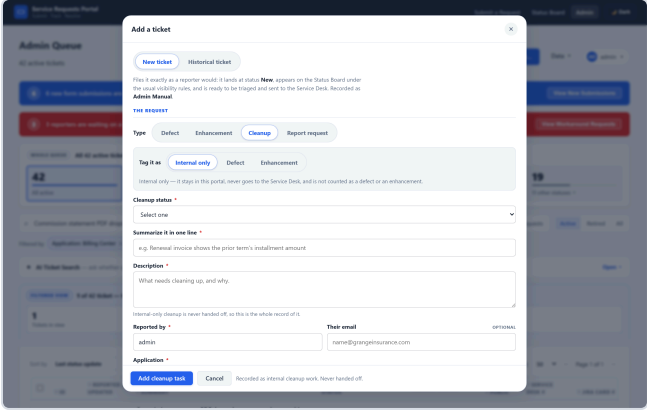

Read the scope in the bar. The header checkbox selects **the entire filtered set, across every page** — not just the rows you can see. The workflow is *filter first, then select all, then apply*.

Changing a filter clears your selection, on purpose: a selection must never straddle two different filtered sets.

2.9 Adding a ticket by hand

Add a ticket... — for something reported by another channel, or recorded after the fact. Two modes across four kinds of work.

New ticket files it as of now. **Historical ticket** is the backdated mode: it asks for the real reported date and the status the ticket already had, and builds the timeline from them.

 New defect	 Historical defect
New ticket → Defect	Historical ticket → Defect
 Historical enhancement	 Cleanup
Historical ticket → Enhancement	Cleanup, tagged Internal only

Report, new

Report request → Something new

Report, change

Report request → A change

A cleanup task is internal work — tidying, archiving, removing something unused. It is not a request type of its own: it is a flag on a defect or an enhancement, and the **Tag it as** row records which. **Internal only** means it was never anybody's bug report, and it stays private by default.

A report request you add by hand has no requester attached, so it will not appear on that person's board. Only a request filed through the form belongs to somebody. An admin recording somebody else's request cannot claim it for them.

2.10 Adding an application, when it isn't in the list

Reporting analysts build reports for systems the portal does not otherwise track. Before this, every one of those had to go into **Other**, so the analyst's own record lost **which system the data came from** — the one thing that field is for.

If you work report requests, you can add one by typing its name in. The control sits in **two** places, and it is the same control:

1. **Add a ticket...** → **Report request**, under the Application picker — you are recording a request for a system that is not in the list.
2. **...** **More** → **Redirect**, on a report request — you have realised an **Other** request is really Marketing Analytics'.

Adding an application

Click “+ **The application isn’t listed**”, type the name, press **Add** or Enter.

What happens then:

- It is created as a **reports-only** application. It accepts **report requests and nothing else** — so it is not offered when you are filing a defect or an enhancement, and it is not a redirect target for one.
- It is **shared immediately with everybody who works report requests**, anywhere. An application is a queue, and a new one nobody can see would be worse than no application at all.

- It appears in the picker you just used, **already selected**.

Refusals say why and keep what you typed:

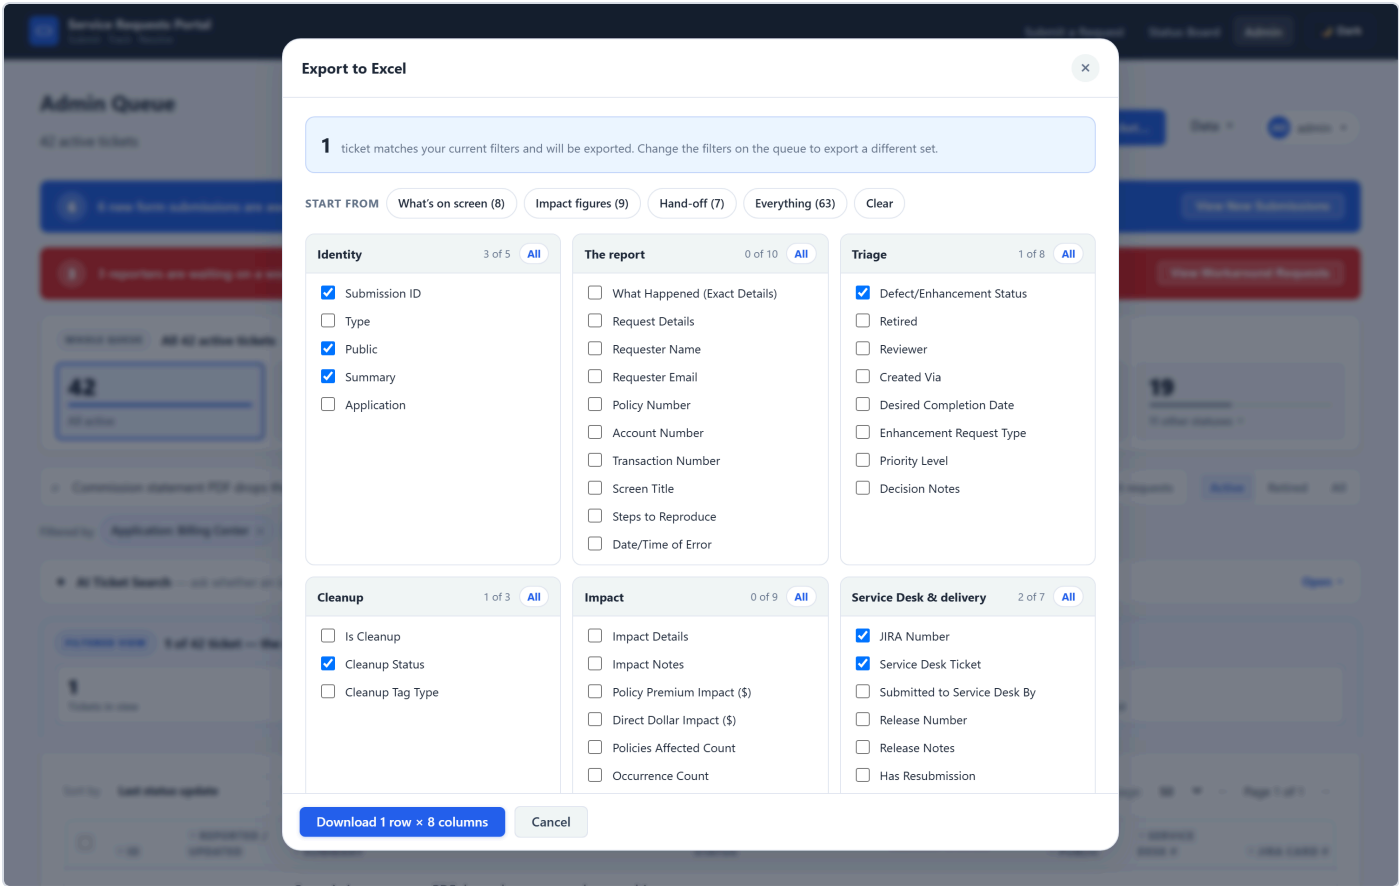

What you typed	What you get
A name already in the list	<i>"Billing Center is already in the list"</i>
A name that exists but is switched off	<i>"... exists but is switched off. A super user can switch it back on."</i> — you cannot see that row, which is why the message says so
Nothing, or over 60 characters	It tells you

Renaming or retiring an application is still a super user's job, on Manage metadata (§2.13). Creating one touches no existing ticket; renaming one renames it on **every ticket that holds it**, which is a different kind of act.

2.11 Excel, both directions

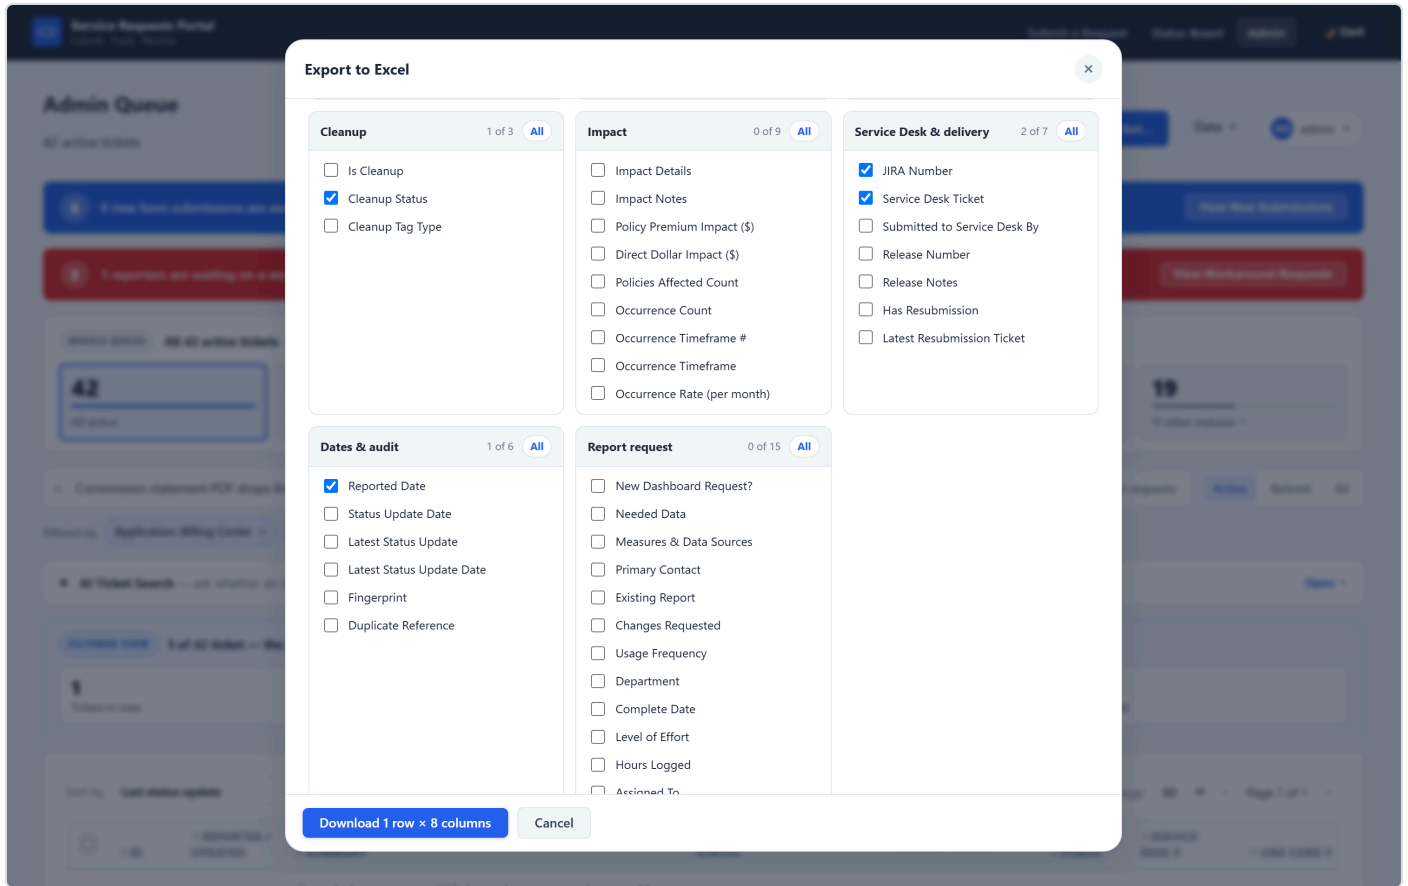

Data → Export Excel or Import Excel.

Export

Export fields

Pick your fields, grouped, with presets (**Everything** / **Clear**). It exports **what your current filters show**, through the same access rules as the queue — so you cannot download more than you can see.

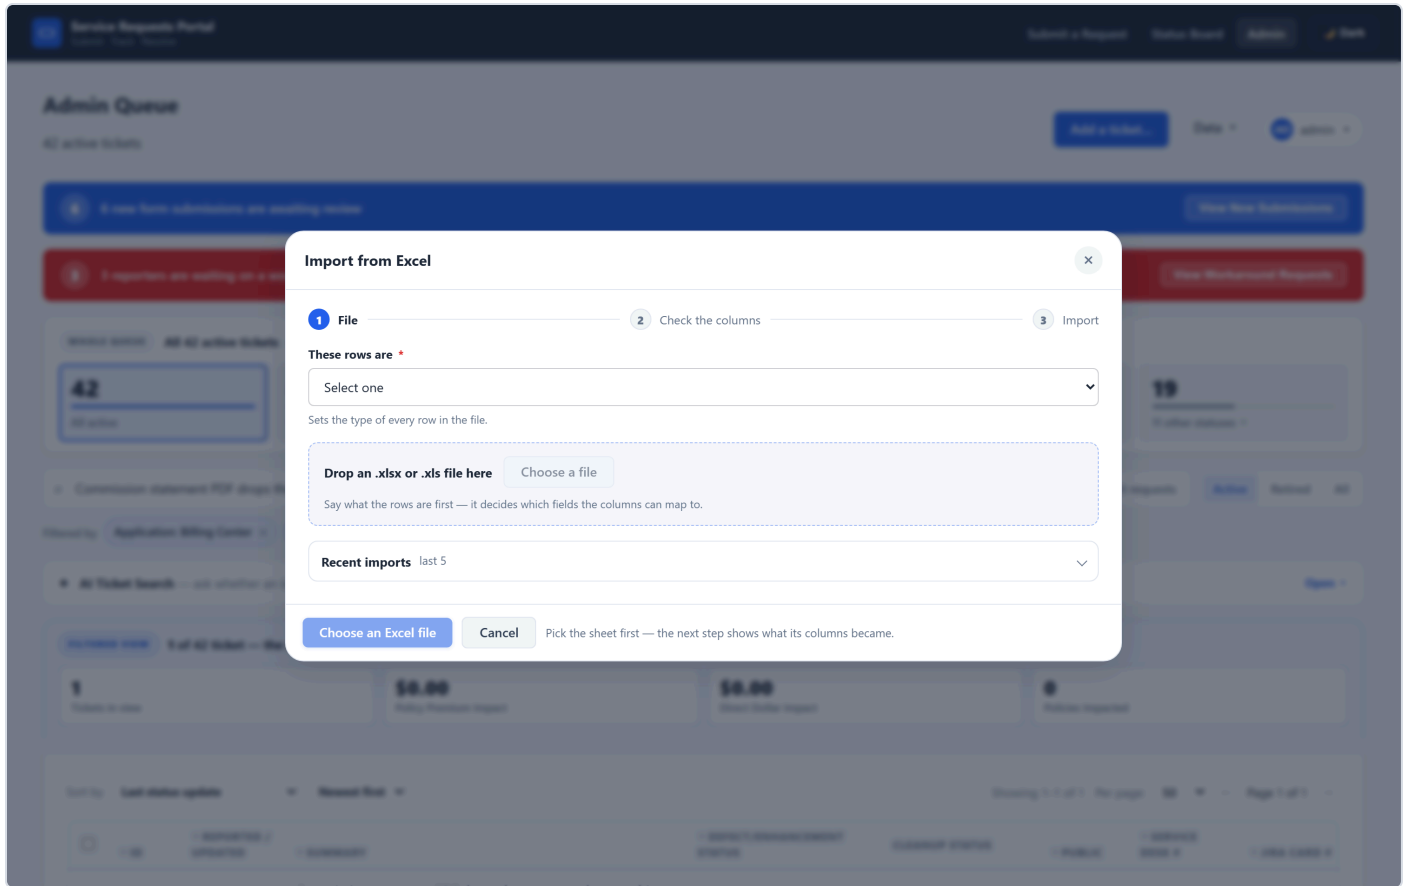

Report request fields

The **Report request** group carries the analyst's half: level of effort, assignee, Approved By, Approved Date, Delivery Notes and **Hours Logged**, which is the total of every hours entry.

Import

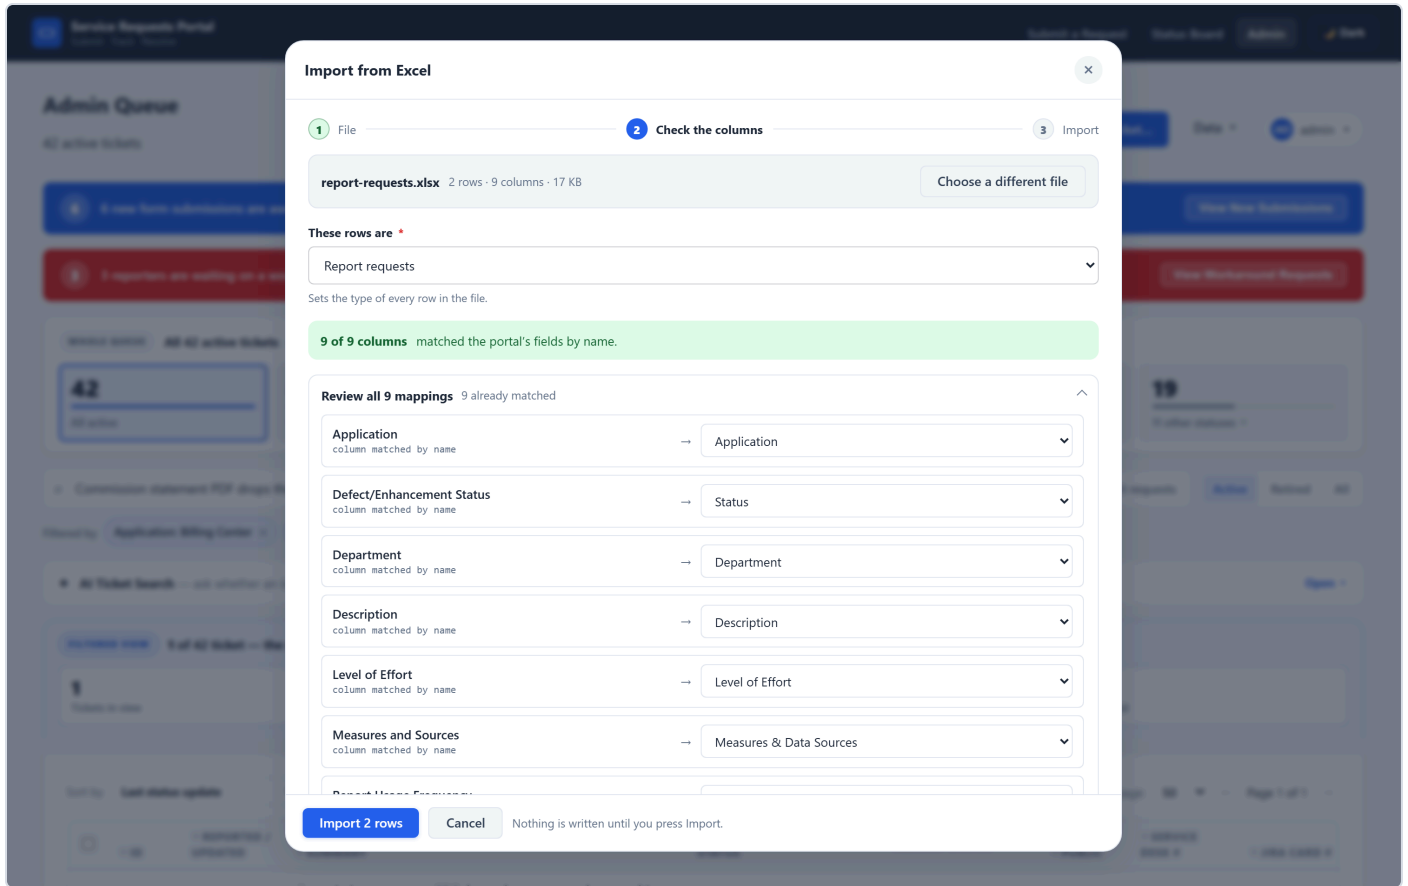

Step 1 — the file, and what kind of tickets it holds.

Import step 1

"**These rows are**" is not optional and not cosmetic: **it sets the type of every row in the file**. A sheet of report requests imported as defects loses every report column. One file, one kind.

Step 2 — check the columns.

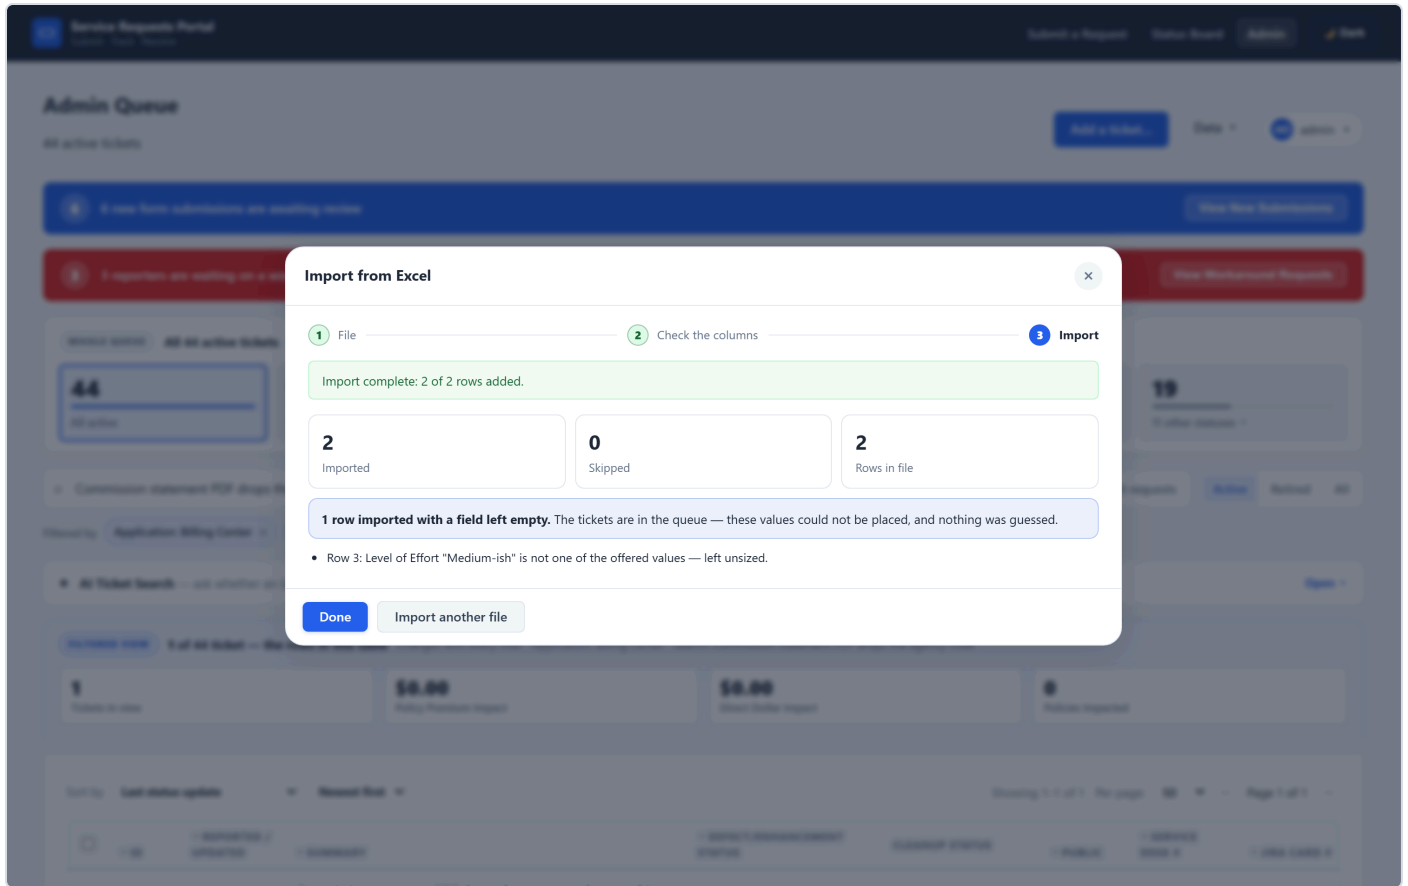

Import step 2

Most columns match themselves — the green banner says how many. The point of this step is the ones that did not: expand **Review all N mappings** to see everything and correct anything. You also get **the first rows as they will be imported**, before anything is written.

Values the portal does not recognise — a status it does not have, a level of effort that is not on the list — are surfaced here for a decision rather than silently dropped.

Step 3 — import.

Import result

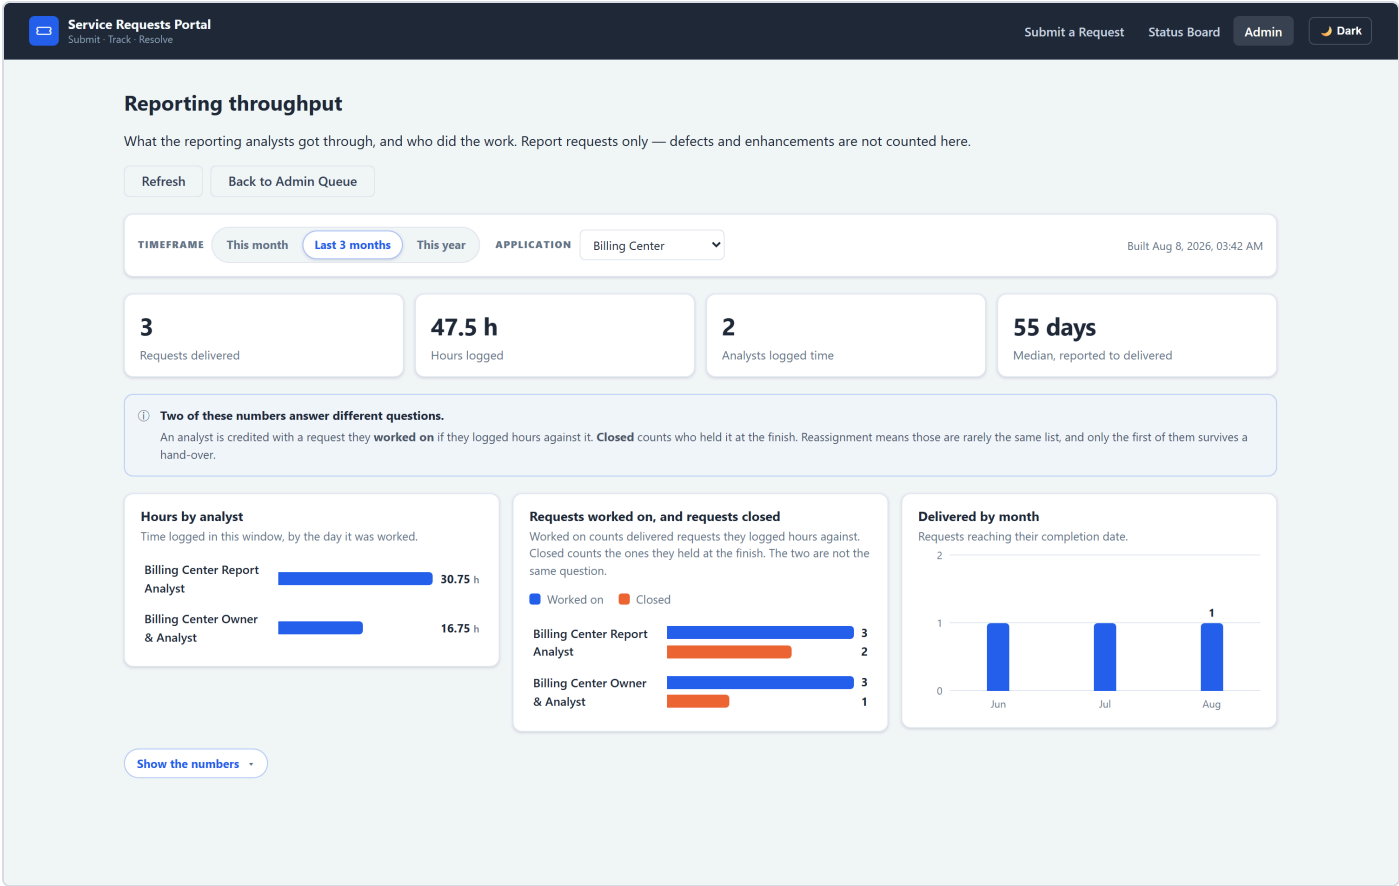

"Nothing is written until you press Import." Afterwards you get what landed, what was skipped and why, and — separately, in a quieter banner — **warnings**: rows that came in **minus a field**. Those two are different things and are never mixed.

A few rules worth knowing before you build a sheet:

- **Assigned To** **must be a person the portal can find** — a display name, username or email — **and they must have access to that row's application**. If it is ambiguous (two people, one spelling) or unknown, the row imports **unassigned** and says why. A name is never stored as free text.
- **Duration** **becomes one hours entry**, credited to that assignee on the day the request completed. With nobody to credit, the number stays out — throughput reporting that invents an owner is worse than one with a gap. A request two analysts shared has to be corrected on the Delivery pane afterwards.
- **A report-request sheet needs no policy or account column.**
- Every import run is recorded, with row counts and errors, under **Recent imports**.

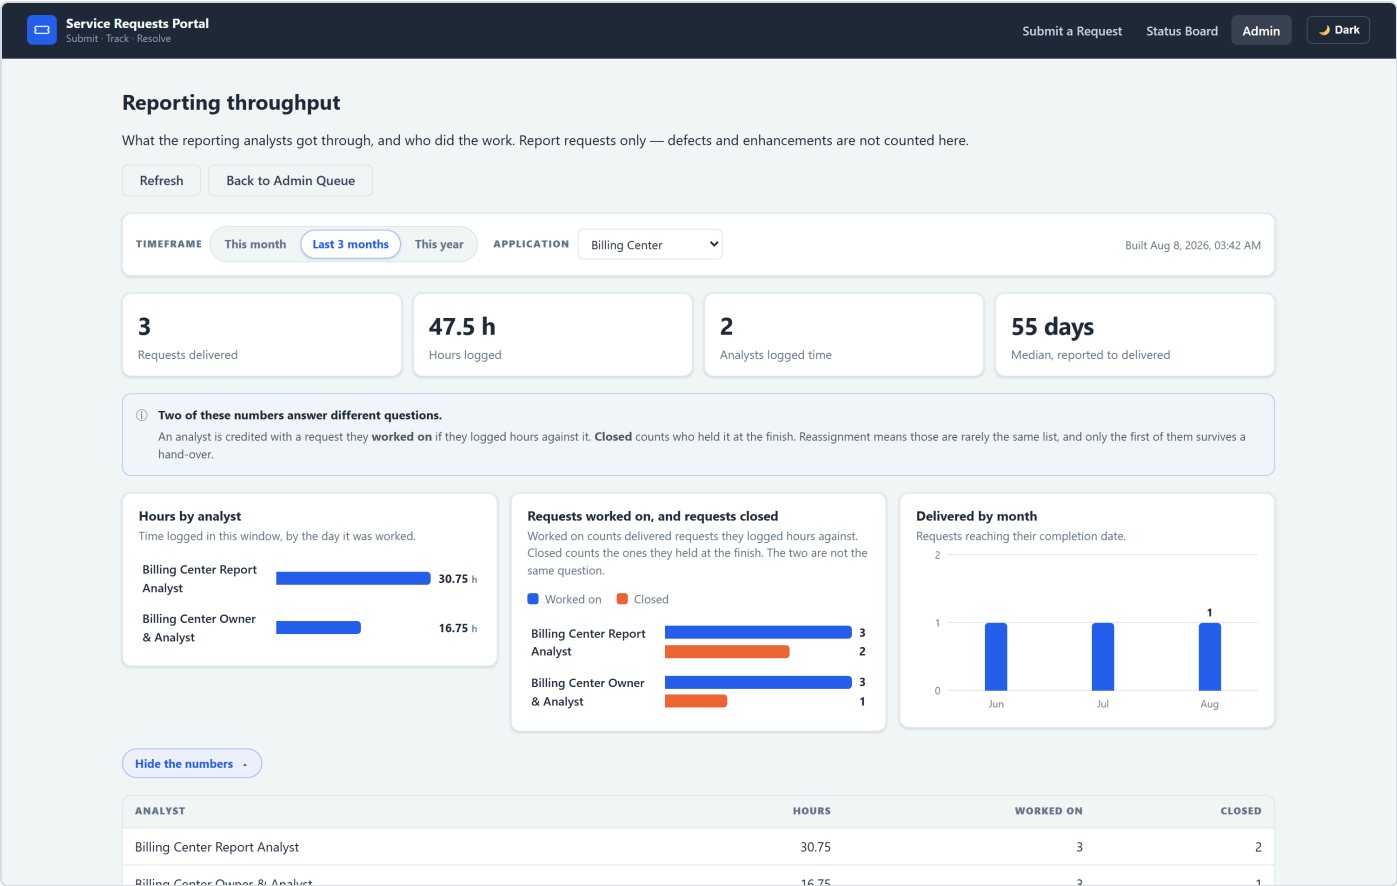

2.12 Reporting throughput

Account menu → Reporting throughput. How much report-request work is being delivered, and by whom.

Throughput

Pick **This month / Last 3 months / This year** and, if you can read more than one, an application.

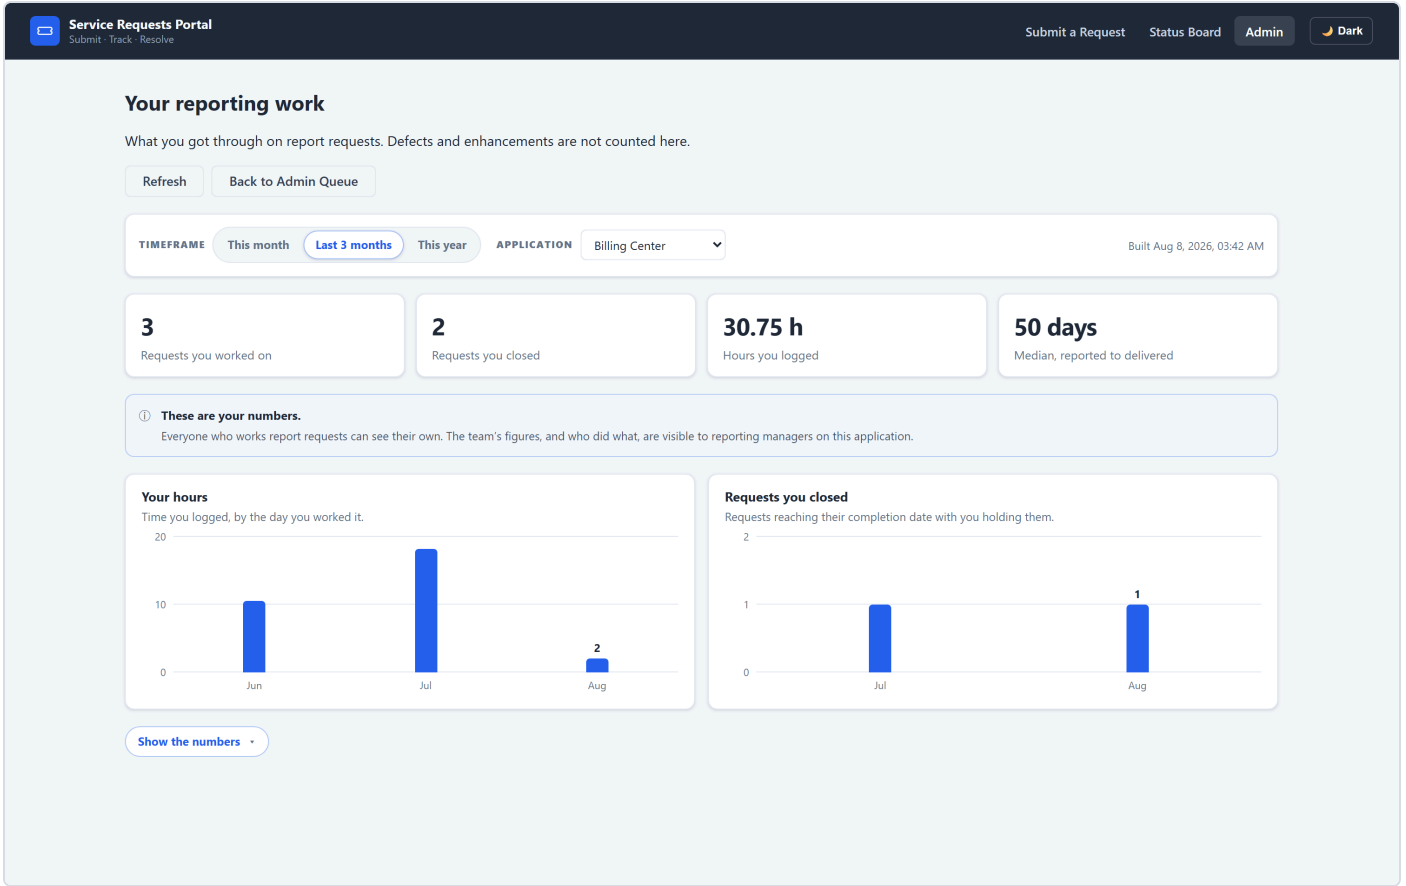

The table

Three numbers that sound similar and are not:

	Means
Delivered	Requests completed in the window
Hours	Hours whose worked-on day falls in the window
Worked	Requests delivered in the window that this person logged any hours against — whenever they logged them

The last one is not windowed on purpose: **a request delivered in August was often worked in July**, and counting only the hours inside the window would erase that person's contribution.

What you see depends on your rank. Unless you have been made a manager of the application, you see **your own** numbers and nobody else's:

Personal view

This is a different page, not the team page with rows hidden — there is no per-colleague mark anywhere on it.

The page states when it was built, and does not update live.

2.13 Manage metadata

Account menu → Manage metadata. Super users only for changes; every admin can read it.

Defect/Enhancement Statuses

16 values

The Status column and Triage tab in the admin queue, the Status filter, and the four-stop track on the public board.

Add a value to defect/enhancement statuses

Add

It goes to the bottom of the list and is offered straight away.

VALUE	IN USE	OFFERED ON NEW TICKETS	ORDER
New	11 tickets	☒ Offered	↑ ↓
Approved	9 tickets	☒ Offered	↑ ↓
Redirected	0 tickets	☒ Offered	↑ ↓
Backlog - Monitoring Impact	1 ticket	☒ Offered	↑ ↓
Future Consideration	1 ticket	☒ Offered	↑ ↓
Deferred – Not in Current Scope	1 ticket	☒ Offered	↑ ↓
Rejected	2 tickets	☒ Offered	↑ ↓

Statuses

Three statuses are marked **Report requests only** — `In progress`, `Delivered` and `On hold`. One list serves every type, so without the marking there would be no way to know which dropdown a value appears in.

Metadata

Every dropdown in the portal reads from a list here. Renaming a value renames it everywhere it already appears; switching one off keeps the tickets that use it and only stops it being offered on new ones.

Consequence

The page tells you what an edit will do before it does it. Renaming a value renames it on every ticket that holds it, on the public board and in every export. A value in use has its name locked.

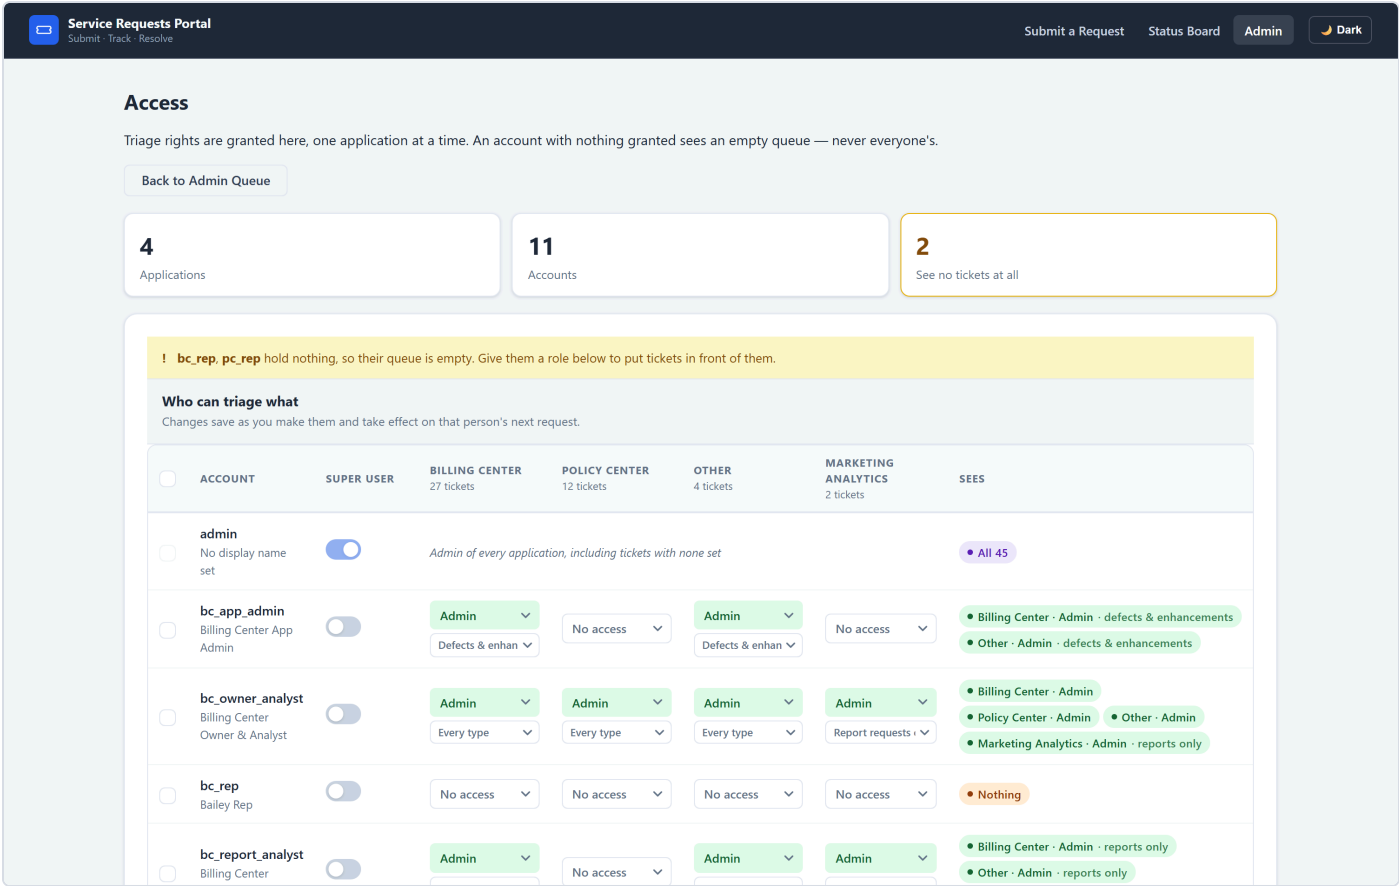

Values are switched off, never deleted — existing tickets keep pointing at them. The **Retired** status is protected outright.

Service Requests Portal — User Manual

Page 58 of 66

2.14 Manage access

Account menu → Manage access. Super users only.

Access

A grid of people against applications. Each cell holds **a role and a scope**:

Role	Can
No access	Nothing. Not on their queue at all.
Viewer	Read that application's queue and export it. Change nothing.
Admin	Everything in that application.
Manager	Everything an admin can, plus see other people's throughput numbers . That is the only difference.

Scope	Covers
Every type	Defects, enhancements, cleanups and report requests
Defects & enhancements	Those two, and the cleanups tagged as them — no report requests
Report requests only	This is what makes somebody a reporting analyst

A combination those three cannot describe shows as **Mixed** rather than being rounded to the nearest one — rounding it would rewrite it on the next save.

Each application shows its ticket count, so removing somebody's access is a decision made with the size of the queue in view.

Three safeguards:

- **Bulk grants are all-or-nothing.** A batch naming one bad application changes nobody — a partially applied access change is the hardest kind to notice.
- **The portal refuses to remove its last super user.** Without one, nobody could reach this page to grant anything back.
- **A change takes effect on that person's very next action**, not their next sign-in.

The page also lists **directory group** → **application** mappings. Those set somebody's **default** application. **They grant nothing** — access is always deliberate.

2.15 Dark mode and phones, on the triage side

The **Dark / Light** button in the header applies everywhere, including the admin pages and the ticket modal.

Dark queue

The queue

Dark metadata

Manage metadata

Dark Delivery pane

A report request's Delivery pane in dark mode. The two chart colours on the throughput page have their own pair per theme, so neither is a light-mode colour dimmed.

Every admin page works on a phone, though the queue is the tightest fit — the table degrades to stacked rows, which is usable for checking something on the move rather than for a triage session.

Phone metadata

Manage metadata

And the two states a requester meets on a phone — the sign-in wall, and the report request branch:

Service Requests Portal — User Manual

Page 62 of 66

Sign in to file a request

Every request — a defect, an enhancement or a report request — is filed under your name, so the team can come back to you with questions and you can follow the ones you filed. Sign in with your work account to continue.

[Sign in](#)

You can still [read the status board](#) without signing in.

Phone sign-in

Submit a service request

Defects, enhancements and report requests all go to the same triage queue. You'll get a reference number and can follow it on the Status Board.

Phone report request

Appendix: test accounts

Every account below uses the same password, the value of `SEED_ADMIN_PASSWORD` in `server/.env` — `admin123` on the prototype.

These are test accounts on test data. **Rotate the password before anybody real uses the portal.**

To see what a requester sees, sign in as `bc_rep`. It has filed most of the report requests in the demonstration data, so the board's "my requests" state and the report-request track both have something to show.

To see everything, sign in as `admin`.

Username	Use it to see
<code>bc_rep</code>	A requester. Files requests, follows their own, no admin side at all.
<code>pc_rep</code>	The same, on the other application.
<code>admin</code>	Everything: every application, Manage access, the metadata writes, and the team throughput view.
<code>lead_admin</code>	An admin who is not a super user — Billing Center, every type.
<code>ops_admin</code>	The same, Policy Center.
<code>bc_app_admin</code>	An application admin for defects and enhancements only on Billing Center. No report requests on their queue.
<code>pc_app_admin</code>	The same, Policy Center.
<code>bc_report_analyst</code>	A reporting analyst — report requests only, Billing Center. No defects on screen, no metadata in the menu.
<code>pc_report_analyst</code>	The same, Policy Center.
<code>bc_owner_analyst</code>	Somebody who does both — every type on Billing Center and Policy Center.
<code>pc_owner_analyst</code>	Policy Center every type, plus report requests elsewhere.

Nobody holds `manager`, so every account except `admin` sees the *personal* throughput view. That is deliberate: it gates seeing colleagues' numbers, and it should be granted on purpose rather than because an account sounds senior.

Appendix: what the statuses mean

Defects, enhancements and cleanup tasks:

Status	Means
New	Filed, nobody has looked at it yet
Requires Additional Review	Triage needs more information or another opinion before deciding
Pending Management Approval	Accepted in principle, waiting on somebody to authorise it
Approved	Accepted as valid work
Submitted	Handed to the Service Desk
Deployed	Released
Backlog – Monitoring Impact	Real, but held while the team counts how often it happens
Future Consideration	Worth doing, not now
Deferred – Not in Current Scope	Out of scope for the current plan
Rejected	Not being done, with a reason
Duplicate	The same as another ticket, which is linked
Redirected	Moved between application queues
Retired	Archived. Nothing in the portal is ever deleted.

Report requests get nine, three of which are theirs alone:

Status	Means
New	Filed, not yet picked up
Approved	Triage accepted it as valid work
In progress	An analyst is building it
Delivered	Built and handed over. Records the completion date.
On hold	Parked — waiting on something outside the work itself
Rejected · Duplicate · Redirected · Retired	As above

They never reach **Submitted** or **Deployed**: both are Service Desk language, and a report request is built in-house.

Appendix: who can see what

Surface	Signed out	A requester	An admin	A super user
Status Board — defects and enhancements	Public ones	Public ones	Public ones	Public ones
Status Board — report requests	None	Only their own	Only their own	Only their own
Filing a request	Cannot	Yes	Yes	Yes
The admin queue	No	No	Their granted applications, their granted types	Every application
A ticket in another team's queue	No	No	Reads as not found (unless their queue handed it on)	Yes
Reporting throughput	No	No	Their own numbers	The team's
Manage metadata	No	No	Read only	Read and change
Manage access	No	No	No	Yes

Two rules behind that table:

- **No grant means no tickets** — never all of them. An admin with no grants sees an empty queue.
- **A ticket you may not see reads as *not found*, not *forbidden*** — so the queue cannot be explored by guessing ticket numbers.
